structure

Problem :

(S)

$$l = 7$$

$$j = 9$$

$$9 > 8.5$$

Frame

* Degrees of Freedom :-

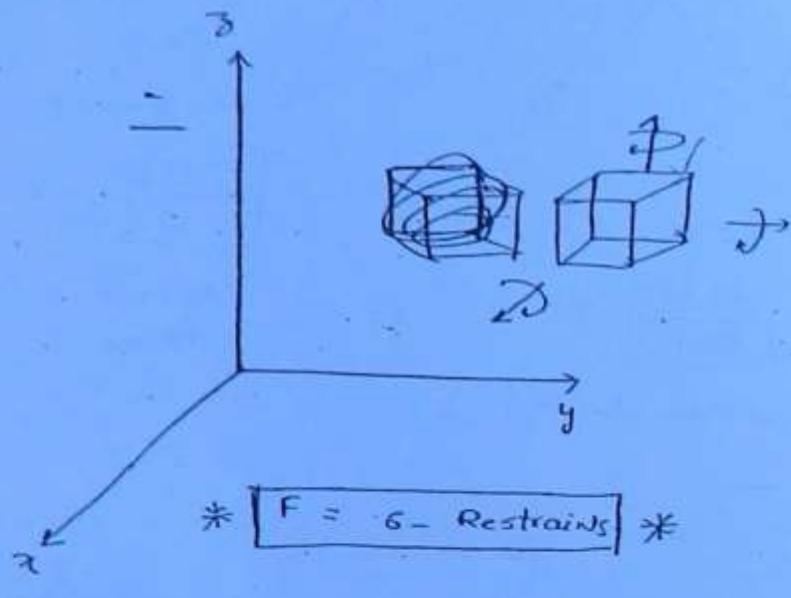

The minimum no. of independent parameters required to define the position or motion of the system is known as Degree of Freedom.

In TDM, restraint are in the form of pair

LP \rightarrow 1 DOF.

HP \rightarrow 2 DOF.

\therefore $F = 6 - \text{Restraints}$

Pair	Restraint	DOF
A	$3I + 2R = 5$	$6 - 5 = 1$
B	$0 \perp T$	$6 - 1 = 5$
C	$1R + 1F = 2$	$6 - 2 = 4$

(1)

Mechanism (3D)
↓
F

l = No. of links
one link fixed

$$F = 6(l-1) - SP_1 - 4P_2 - 3P_3 - 2P_4 - IP_S$$

P_1 = No. of those pair whose DOF. $\Rightarrow 1$

$$P_2 \text{ do } = 2$$

$$P_3 \text{ do } = 3$$

$$P_4 \text{ do } = 4$$

$$P_5 \text{ do } = 5$$

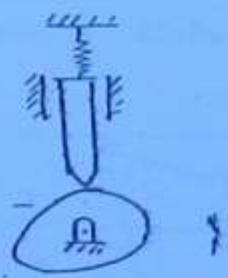

3) According to the type of closure:

a) Self closed Pair (closed pair): -

Permanent contact. Sliding pair, ball bearing, cylinder & piston.

b) Forced closed Pair (Unclosed Pair): - Forceful contact

e.g.

cam and
follower

e.g. automatic clutch operating system
door closure

* Kinematic chain:-

If all the links are connected in such a way that first link is connected to the last link to form a closed chain and the relative motion between any two links is the constrained motion and such a chain is known as kinematic chain.

When one of the link of the kinematic chain is fixed it becomes a mechanism which can give desired output w.r.t some given input.

A mechanism or groups of mechanism when utilized and when desired output is obtained it becomes a machine.

- Conditions for the kinematic chain :-

⇒

$$l = 2p - 4$$

l = No. of links

p = No. of kinematic Pairs

$$j = \frac{3}{2}l - 2$$

→

$$j + h = \frac{3}{2}l - 2$$

where,

~~$j = \frac{3}{2}l - 2$~~

h = No. of higher pair

where j = No. of binary joints

l = No. of links

$$j = \frac{3}{2}l - 2$$

$$l = 4$$

$$j = 4$$

$$4 = \frac{3}{2} \times 4 - 2$$

$$\boxed{4 = 4}$$

Kinematic chain.

$$j > \frac{3}{2}l - 2$$

No relative motion

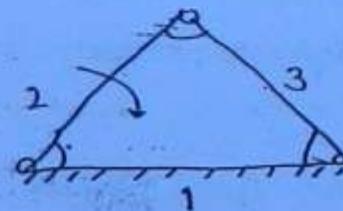

Frame/structure

$$l = 3$$

$$j = 3$$

$$\boxed{3 > 2.5}$$

⑥

motion and Power can't be transmitted
only force can be transmitted.

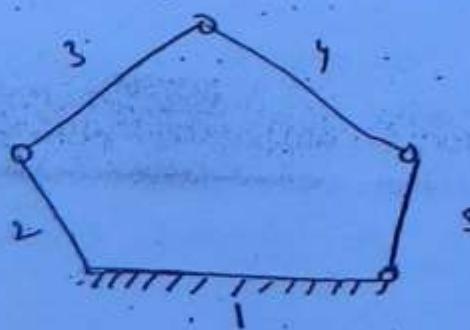

$$j < \frac{3}{2}l - 2$$

Relative motion

⇒ Unconstrained

$$\boxed{5 < 5.5}$$

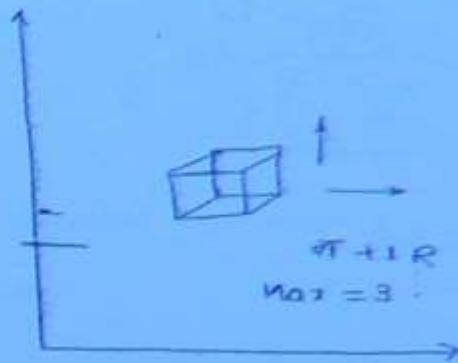

Planner Mechanism

R.D.

$$F = 3(l-1) - 2P_1 - 1P_2$$

P_1 = No. of ID LP or Binary joint
(i)

P_2 = No. of Rigid H.P. \rightarrow h

$$\therefore \boxed{F = 3(l-1) - 2j - R} \rightarrow \text{Kutzbach criterion Equation}$$

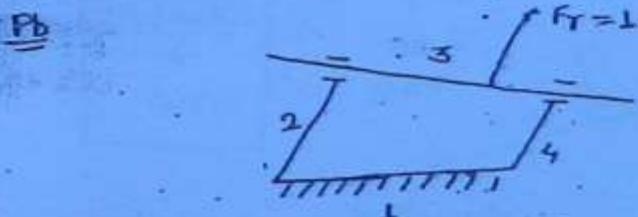

$$\boxed{F' = [3(l-1) - 2j - R] - f_y}$$

2

(Redundant degree of freedom)

↓

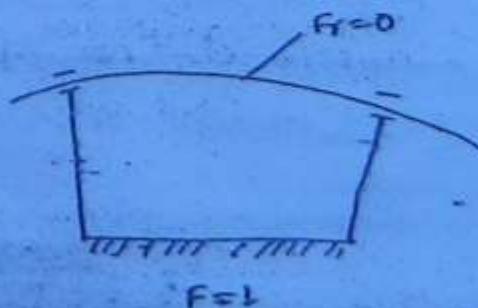

those independent motions which are not the part of the mechanism.

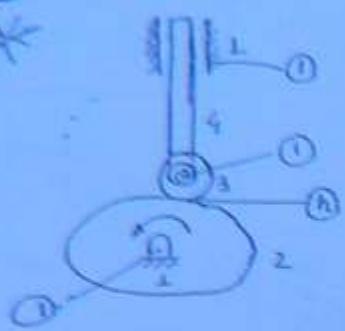

$$l = 4 \quad j = 4 \quad h = 0$$

$$\text{Ans } F = 0$$

$$F = 3(l-1) - 2 \times j - R = 3(4-1) - 2 \times 4 - 0 = 1 - f_x = 0,$$

$$l = 4 -$$

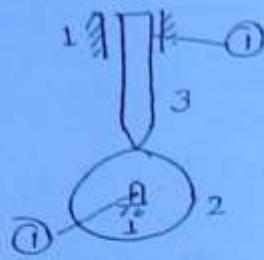

$$s = 3$$

$$h = 1$$

$$F = [3(4-1) - 2 \times 3 - 1] = 1$$

$$= 1 - 1$$

$$= 1 -$$

$$l = 3$$

$$s = 2$$

$$h = 1$$

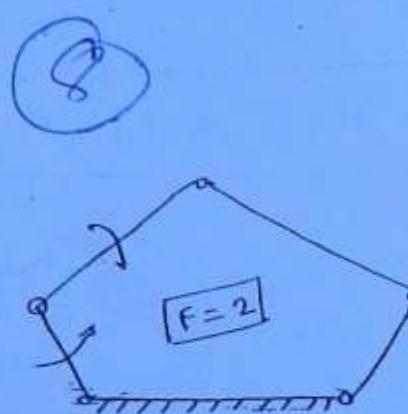

$$F = 3(3-1) - 2 \times 2 - 1 = 1$$

If $F = 0$ → Frame / structure

Three inversion can be obtained.

3. Slotted Plate Fixed :-
(Elliptical Trammels)

$$\sin \theta = \frac{y}{BQ} \quad \cos \theta = \frac{x}{AB}$$

$$\therefore \sin^2 \theta + \cos^2 \theta = 1$$

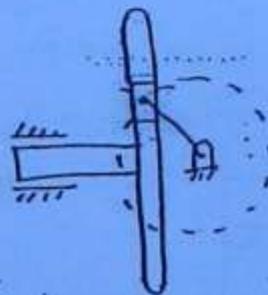

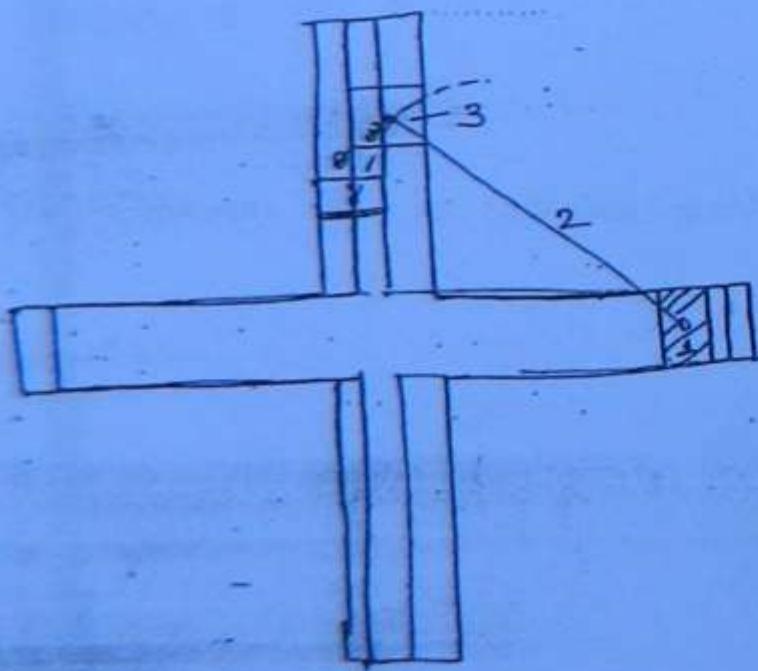

$$\text{or, } \frac{y^2}{BQ^2} + \frac{x^2}{AB^2} = 1$$

Ellipse

If Q is mid-point we can obtain a circle.

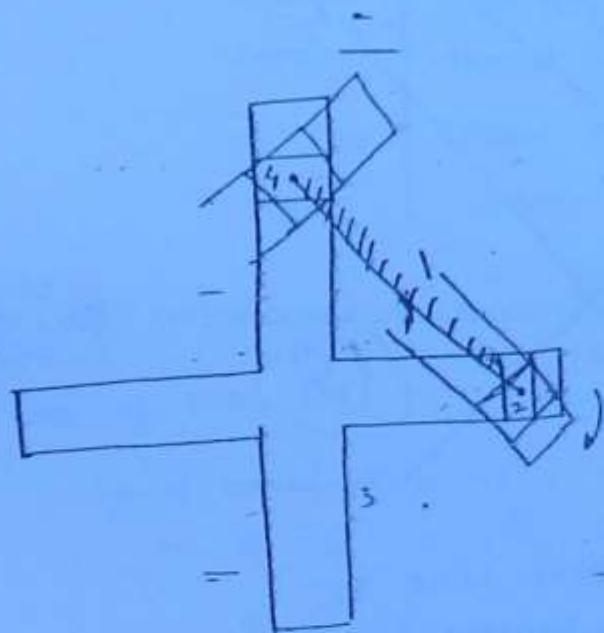

(6)

2. Any one of the sliders is fixed :
or, Scotch-Yoke Mechanism (Rot \longleftrightarrow Reciprocation)

3. Link connecting ^{rod} stator is fixed:
(oldham's coupling)

"This coupling is basically used to connect the two shaft which has
~~need~~ lateral misalignment"

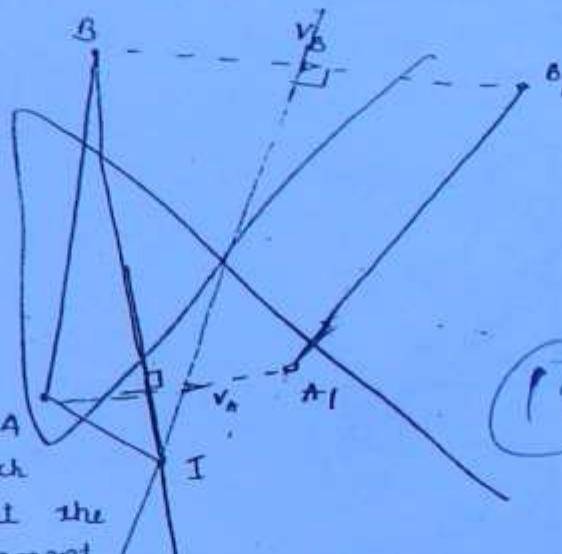

12

Velocity Analysis

1) Instantaneous Centre Method Approach :-

- Instantaneous centre of Rotation :

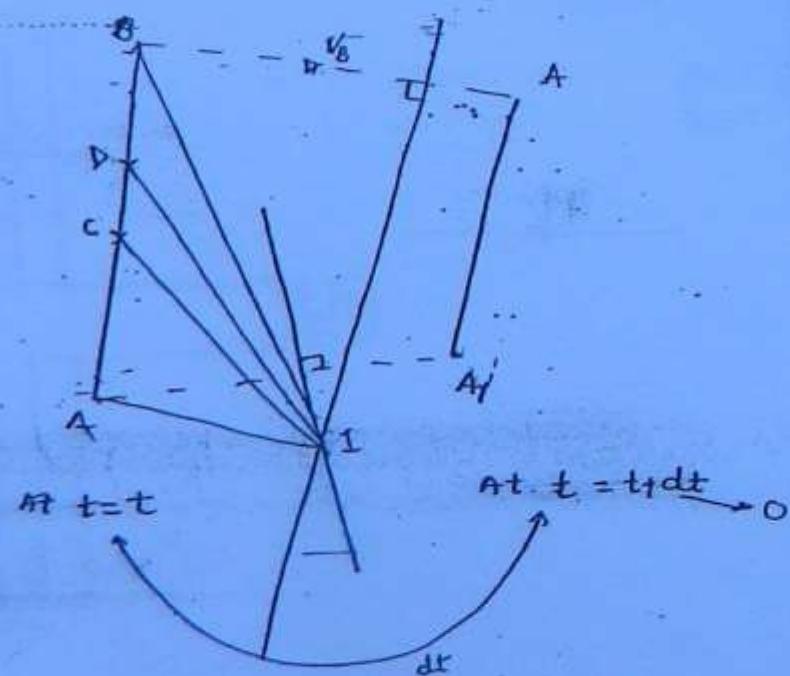

In general a motion of a link in a mechanism is neither purely translational nor purely rotational it is the combination of translation and rotation, which is the general motion but the whole link at any movement can be assumed to be in perfect rotation w.r.t to a point in the space known as Instantaneous centre of rotation. This point is also known as virtual centre.

(18)

$$\omega_{AB} = \frac{v_A}{AI} = \frac{-v_B}{BI}$$

$$= \frac{v_C}{CI} = \frac{v_D}{DI}$$

As the link is in motion its I-center keeps on changing the locus of the I-center for a particular link during its whole

motion is known as centre of the link.

The locus of instantaneous axis of rotation for a particular link during its whole motion is known as Axode of the link

Centrode	Axode
Curve	curved surface
st. line	Plane surface
Point	line

No. of instantaneous centres in the Mechanism :-

$$\text{No. of links} = l$$

No. of combinations i.e.,

$$\text{No. of IC} = {}^l C_2 = \frac{l(l-1)}{2}$$

if $l=4$

${}^l C_2 = 6$

$$\begin{matrix} 12 & 13 & 14 \\ & 23 & 24 \\ & & 34 \end{matrix}$$

$l=5$

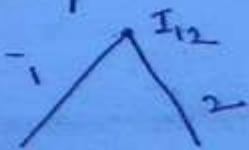

${}^l C_2 = 10$

$$\begin{matrix} 12 & 13 & 14 & 15 & 16 \\ & & 23 & 24 & 25 \\ & & & 34 & 35 \\ & & & & 45 \\ & & & & 56 \end{matrix}$$

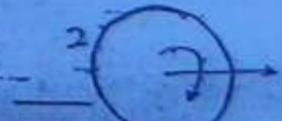

(19)

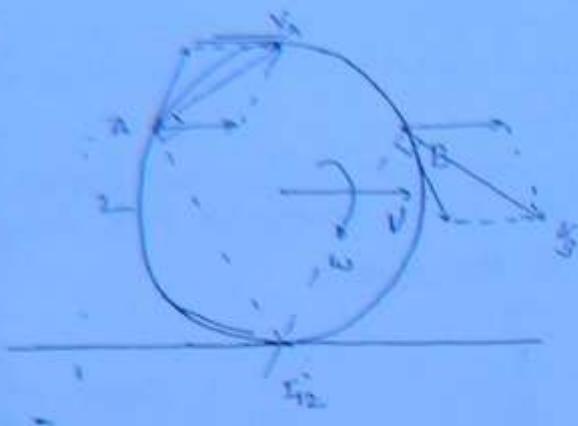

* Basic Instantaneous centre in the mechanism :-

1. Turning Pair

2. Rolling Pair :-

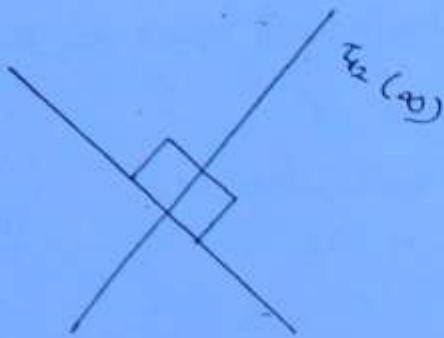

3. Sliding pair.

$$\omega_2 = 5 \text{ rad/s} \text{ (clockwise)}$$

$$\omega_3 = 14 \text{ rad/s}$$

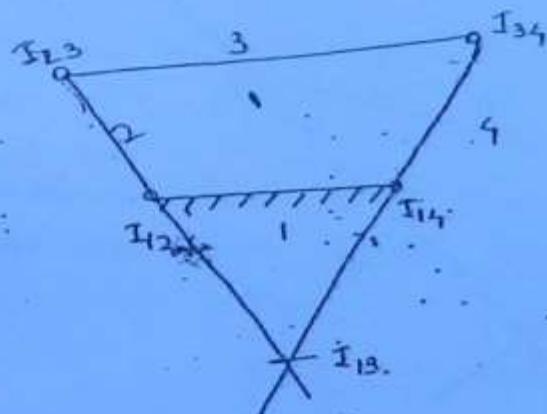

what will be the angular velocity
of link 2 w.r.t link 3

$$\begin{aligned}\omega_{23} &= \omega_2 - \omega_3 \\ &= (+5) - (-14) \\ &= +19 \\ &= 19 \text{ (clockwise)}\end{aligned}$$

23

Pb.

$$\begin{aligned}\omega_{23} &= +5 - (+9) \\ &= -9 \\ &= 9 \text{ (AC).}\end{aligned}$$

* Relative Velocity Approach :-

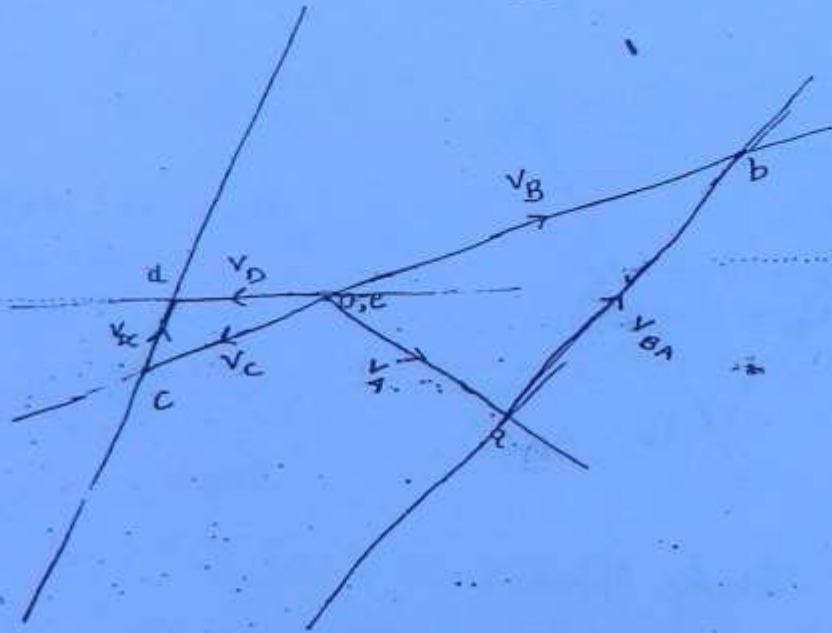

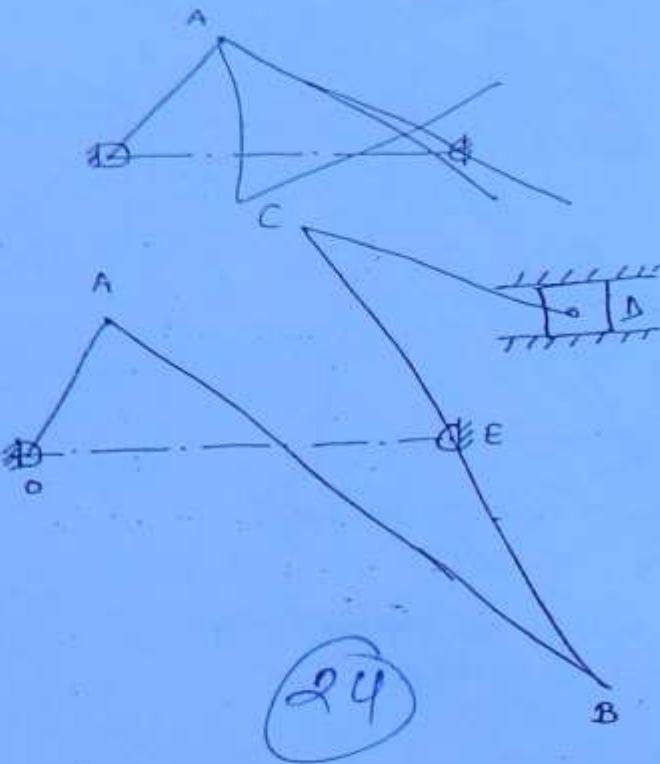

Velocity of point A w.r.t B
will be in the direction

\perp^{ar}

to the link AB

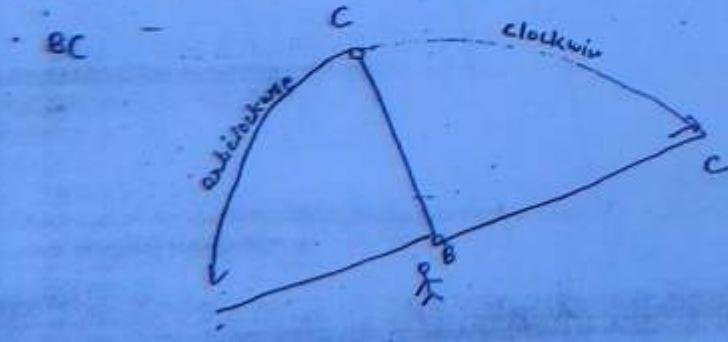

Point	link	Procedure
A	O	line \perp^{ar} to OA
B	A	line \perp^{ar} to AB
C	E	line \perp^{ar} to EB
C	$\frac{BC}{BE} =$	$\frac{bc}{be} \rightarrow ?$
D	C	line \perp^{ar} to CD
D	fixed	line to the motion of slider

For direction:

- See the configuration diagram.

→ ~~opp~~
direction of link
BC is anti-clock
wise

* Simple Mechanisms :-

First harmonic motion \rightarrow Simple Harmonic Motion

all the first mechanism is simple mechanism

- Link :-

Every part of a machine which is having relative motion with respect to some other part is known as kinematic link or element

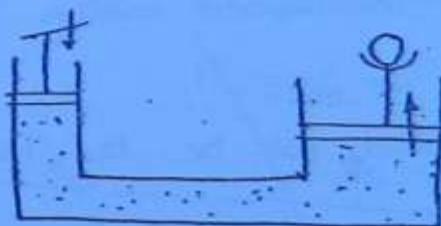

Note :- It is not necessary for the link to be rigid only but it is necessary for the link to be a resistant body so that it is capable of transmitting power from one body to the other ~~no~~ body.

Rubber - flexibility /

Q5

- Types of Link :-

- 1) Rigid link : deformations are negligible e.g., piston connecting rod, piston etc.
- 2) Flexible link : deformations are there but they are ⁱⁿ permissible zone.
e.g. belt drive, rope drive etc.
- 3) Fluid link : sometimes fluid power is transmitted - because of the fluid pressure in that case fluid behaves like a link. e.g. hydraulic break, coupling, jack, press, crane, lift etc.

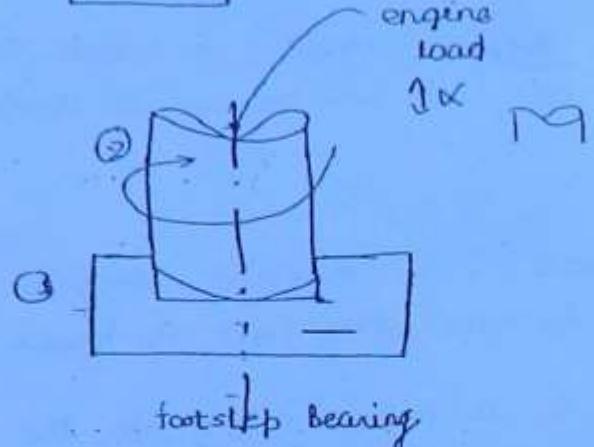

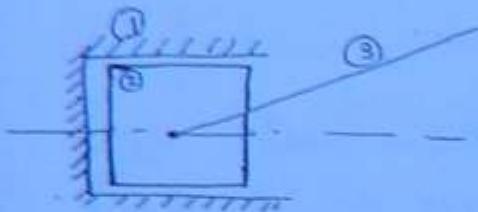

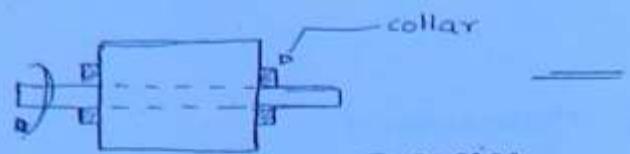

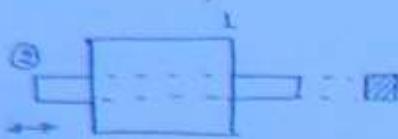

- Types of Relative motion :-

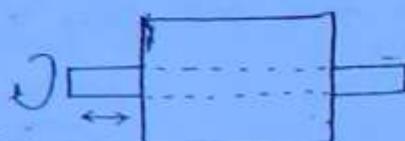

- 1) Completely constrained motion :-
(self).
- 2) Successfully constrained motion :

} constrained : design desired
(only one output w.r.t. input).

- 3) Incompletely constrained motion :] Unconstrained : (more than one output at same input)

(3)

Incompletely constrained motion

26

* Kinematic pair :-

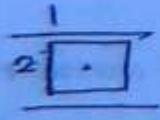

The connection between two links is always a joint or a pair but this pair is said to be kinematic pair if the relative motion between the links is the constrained motion.

Every kinematic pair is a pair or joint.

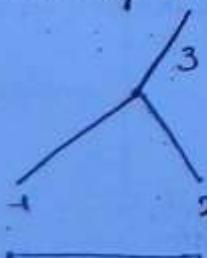

But every pair or joint may or may not be the kinematic pair.

* Types of joints :-

Binary joints :-

Tertiary joint

→ (1,2)
→ (2,3)
→ (1,3)

24/06/2011

* Classification of Kinematic Pair :

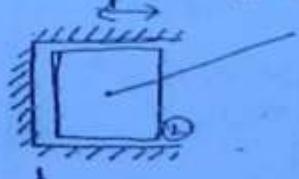

a) According to the types of relative motion between the links :

a) Turning Pair (Revolute Pair) (Pin-joint) :-

b)

b) Sliding Pair (Prismatic pair) :-

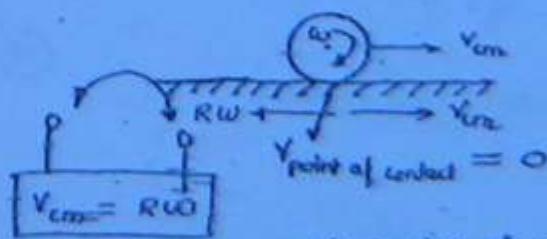

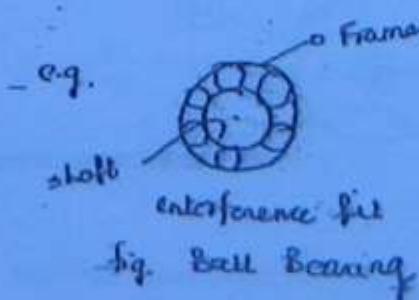

} static friction is variable

c) Rolling Pair :

→ relative motion is pure rolling

Pure rolling
without
slipping

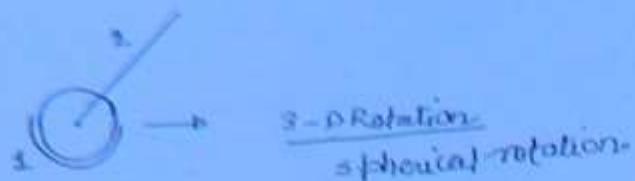

single start thread
linear movement = pitch
double start = 2 pitch
and so on.

d) Screw Pair

Nut and Bolt.

Q) Spherical pair (Ball and socket joint)

- Air stand
- mirror of bike

Q) According to the type of contact :-

Q) Lower pair : \rightarrow surface contact

e.g., TP, SP, screw pair, spherical pair

(30)

Q) Higher pair : \rightarrow point / line contact \therefore Rolling Pair
e.g. cam and follower.

Q) Wrapping pair : - one link is wrapped over other

e.g. belt & pulley =, rope and pulley

$$1HP = 2TP$$

$$1HP = 2LP$$

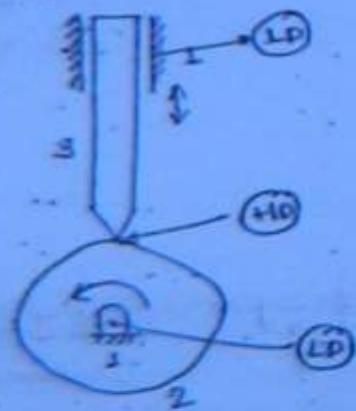

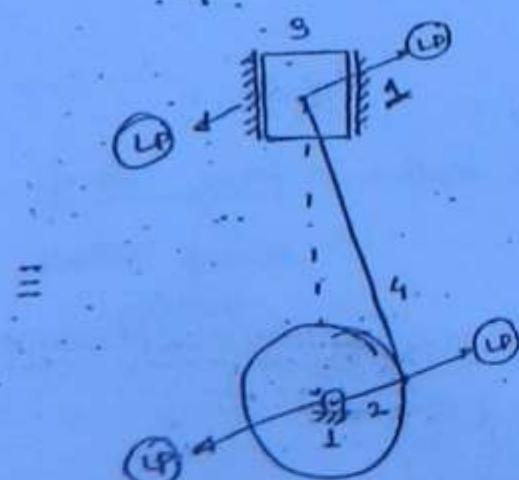

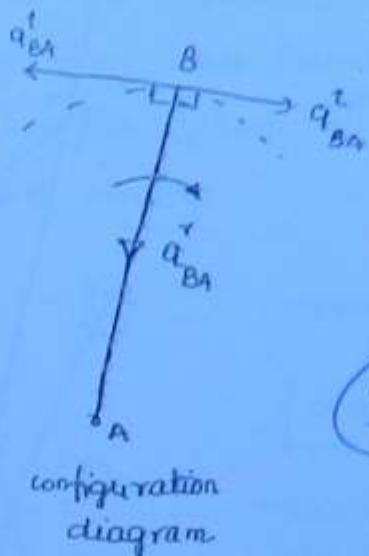

Fig. Cam and follower

Acceleration Analysis

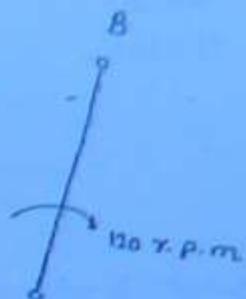

$$a_{BA}^T = \frac{v_{BA}^2}{AB} \quad (B \rightarrow A) \quad (\text{All known})$$

$a_{BA}^T = (BA) \alpha_{BA}$
 (1st to radial)

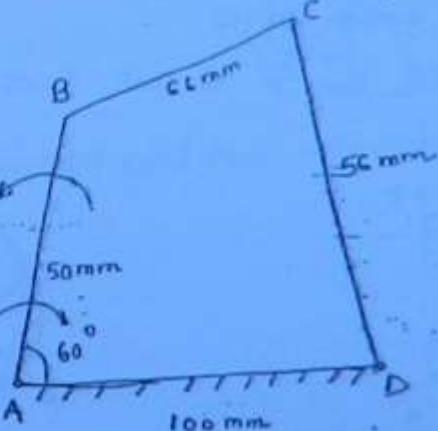

(31)

and acceleration is
not given take it
as zero.

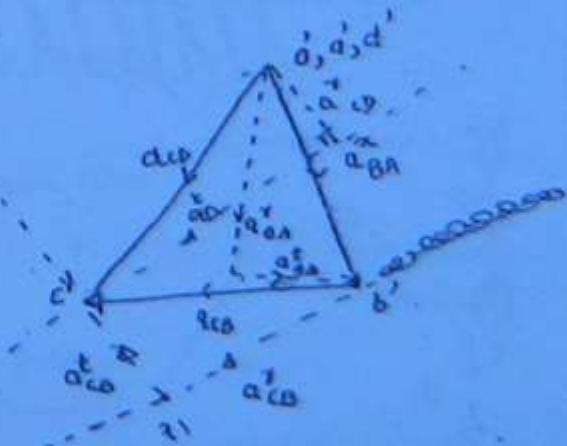

Ex:-

Point	w.r.t	Procedure
B	A	$a_{BA}^T = \frac{v_{BA}^2}{AB} \quad (\text{given}) \quad (B \rightarrow A) \quad w = 10.5 \text{ rad/s}$ $a_{BA}^T = (BA) \alpha_{BA} \quad (\text{given})$ (1 st to radial)
C	B	$a_{CB}^T = \frac{v_{CB}^2}{CB} \quad (C \rightarrow B) \quad (\text{known})$ $a_{CB}^T = (CB) \alpha_{CB} \quad (\text{Unknown})$ (1 st to radial)
C	D	$a_{CD}^T = \frac{v_{CD}^2}{CD} \quad (C \rightarrow D) \quad (\text{known})$ $-a_{CD}^T = \alpha_{CD} \quad (\text{Unknown})$ (1 st to radial)

$$\alpha_{BC} = ? \quad (34.09 \text{ rad/s}^2)$$

$$\alpha_{CD} = ? \quad (79.11 \text{ rad/s}^2)$$

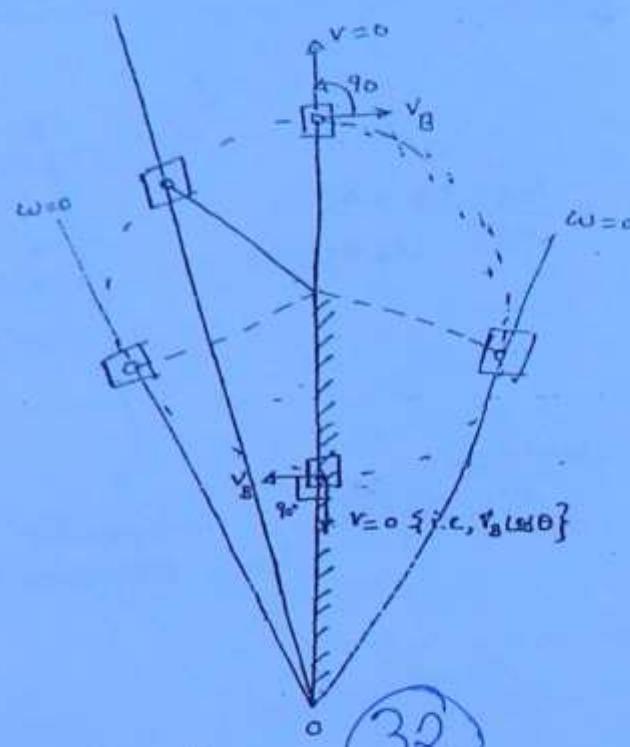

Note:- radial component of
acceleration can never be
zero. in a circular motion.

\rightarrow ~~Coriolis accⁿ~~ :-

This acceleration is associated with the slider, if the slider is sliding on a rotating object.

$$d = 2V\omega \rightarrow \omega \text{ of the body on which sliding is there}$$

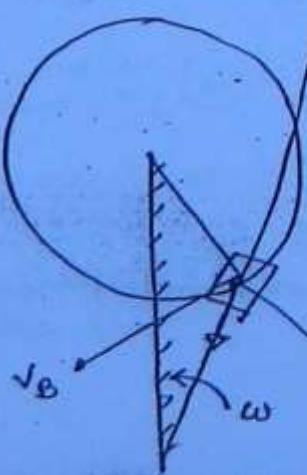

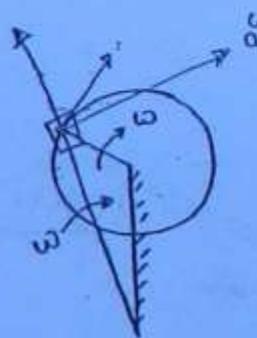

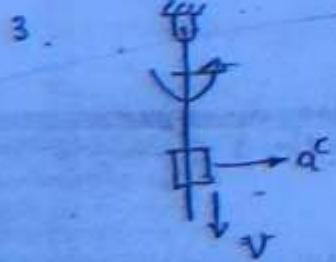

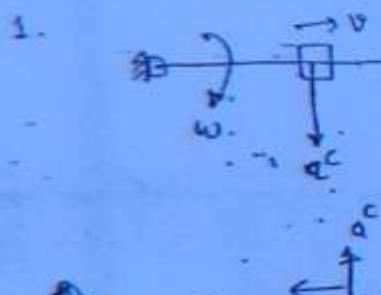

↑
sliding velocity of slider

Direction of a^c : (Tangential).

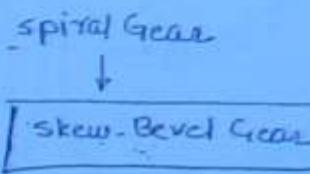

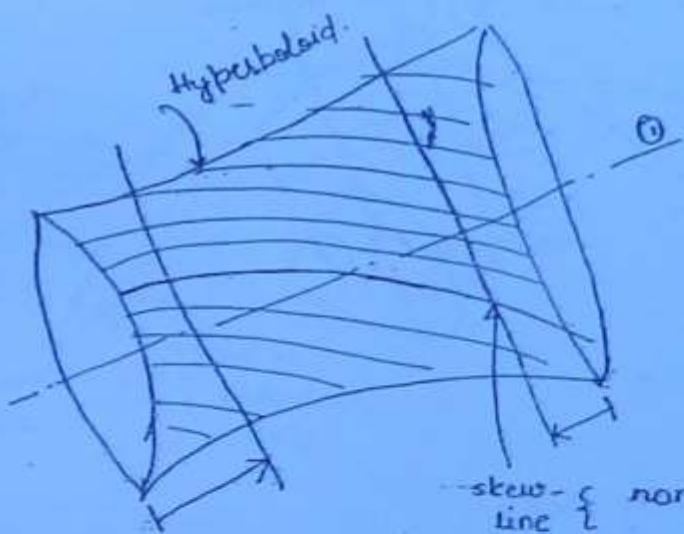

i) Take the sense of ω

ii) ~~rotate~~ Rotate the \vec{v} in that sense by 90° .

iii) When the shafts are neither parallel nor intersecting :-

When the shafts which are non-parallel & non-intersecting are supposed to be connected, any kind pure rolling motion is impossible. Therefore, the motion which is possible is the rolling motion having some partial sliding.

when the end section of hyperboloid is used to form a spiral gear \rightarrow Hypoid Gear.

33

non-parallel and non-intersecting }

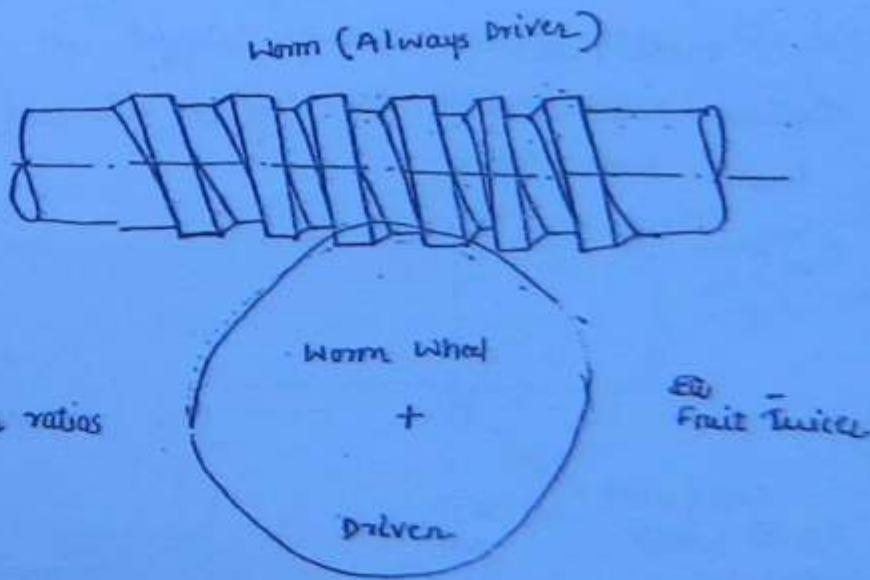

- * Worm & Worm Gear
- D (less)
- D (more)
- spiral angle ψ
- high
- less
- Very high speed reduction ratios

10 : 1

30 : 1

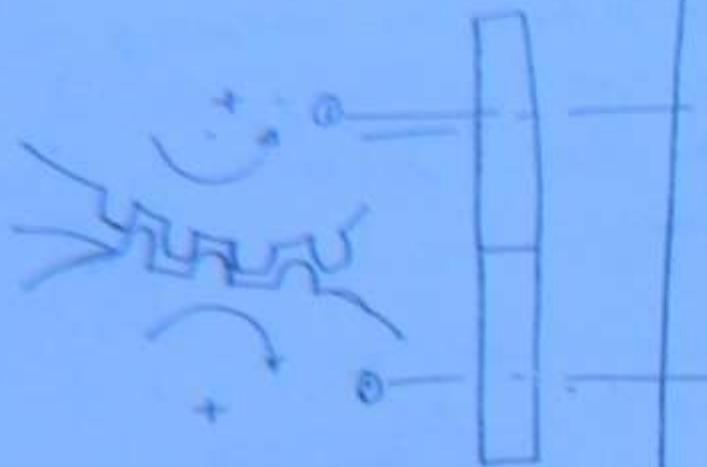

300 : 1

1000 : 1

2) According to the type of gearing :-

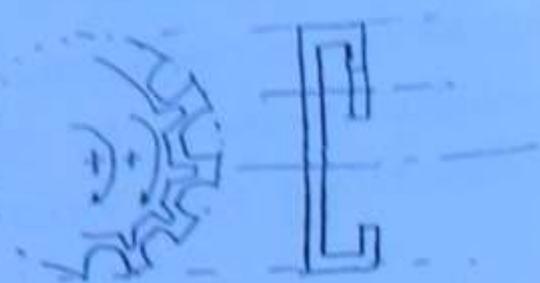

External Gearing

Spur → Gear or Spur

Smaller → Pinion

Internal Gearing

Bigget - Annular

Smaller - Pinion

(39)

3) According to the tangential speed :-

$v < 3 \text{ m/s}$ → low velocity gear

$3 \leq v < 15 \text{ m/s}$ → Medium velocity gear

$v > 15 \text{ m/s}$ → High "

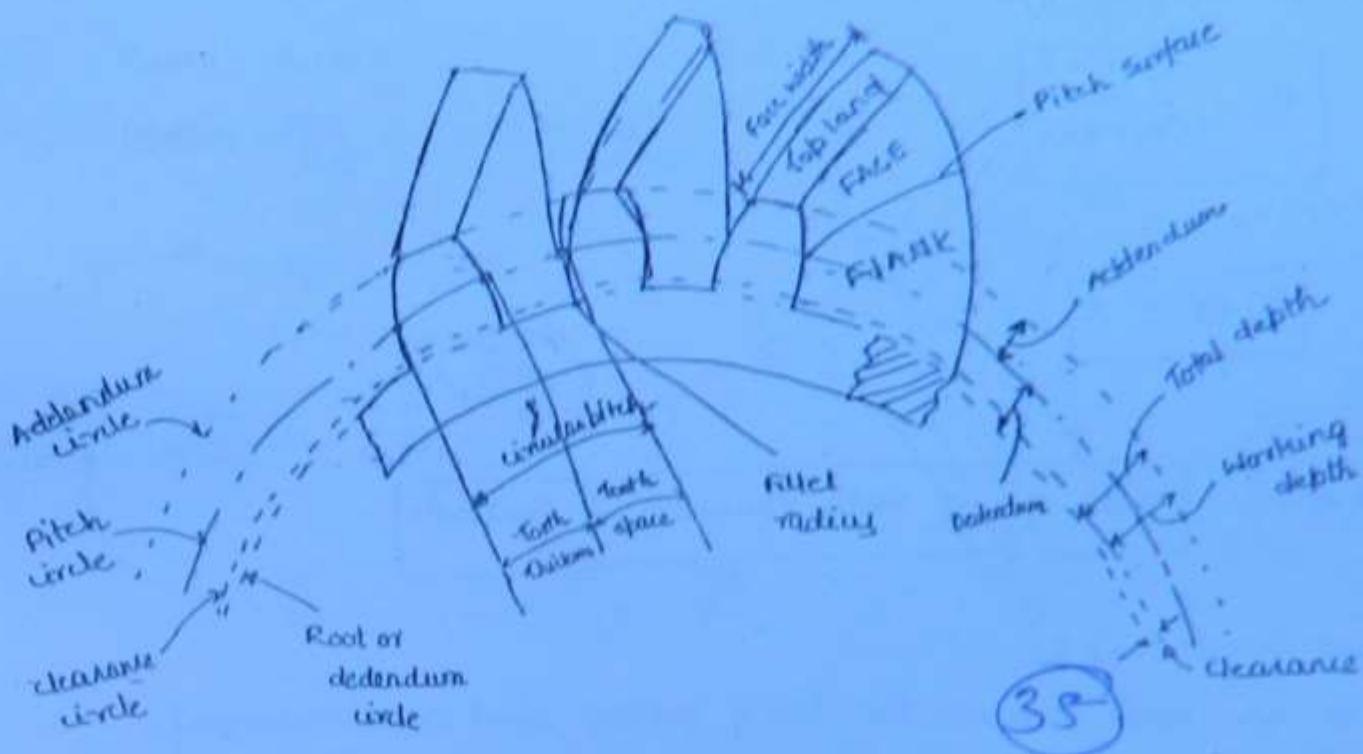

4) According to the type of teeth:-

st. teeth gear

Inclined teeth gear

Curved teeth gear.

K Gear Terminology :-

1) Pitch circle:-

It is an imaginary circle on which pure rolling motion is observed. Being an imaginary circle it can't be a physical characteristic of the gear but being the most important circle of the gear it is the biggest specification of gear. The size of the gear is defined by the dia. of pitch circle.

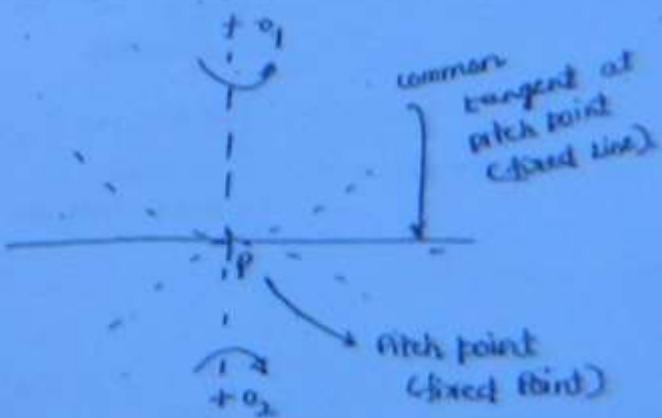

2) Circular Pitch (P_c) :-

$$P_c = \frac{\pi D}{\tau}$$

For two mating Gears :-

$$P_{c1} = P_{c2}$$

$$\Rightarrow \frac{\pi D_1}{\tau} = \frac{\pi D_2}{\tau} \Rightarrow |D_1 - D_2|$$

3) Modulus (m) :-

$$m = \frac{D(\text{mm})}{T}$$

To avoid the stress concentration
sharp corner is avoided and
fillets are provided.

4) Diametral Pitch (P_d) :-

$$P_d = \frac{T}{D(\text{inch})}$$

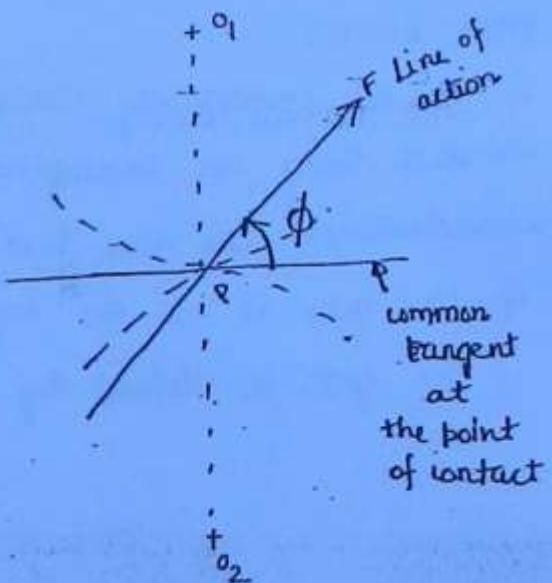

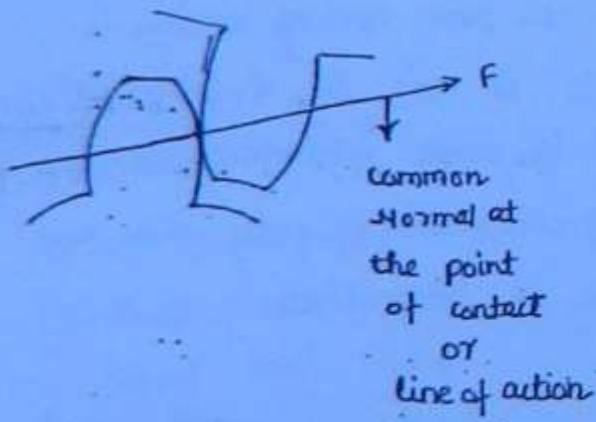

$$P_c \cdot P_d = \pi$$

(36)

*** * Tooth space - tooth thickness = Backlash

5) Pressure Angle (α) :-

It is an angle between the line of action and common tangent at pitch point.

* Law of Gearing :-

P \swarrow O₂ Line
Line of action

For proper contact

$$V_1 \cos \alpha = V_2 \cos \beta$$

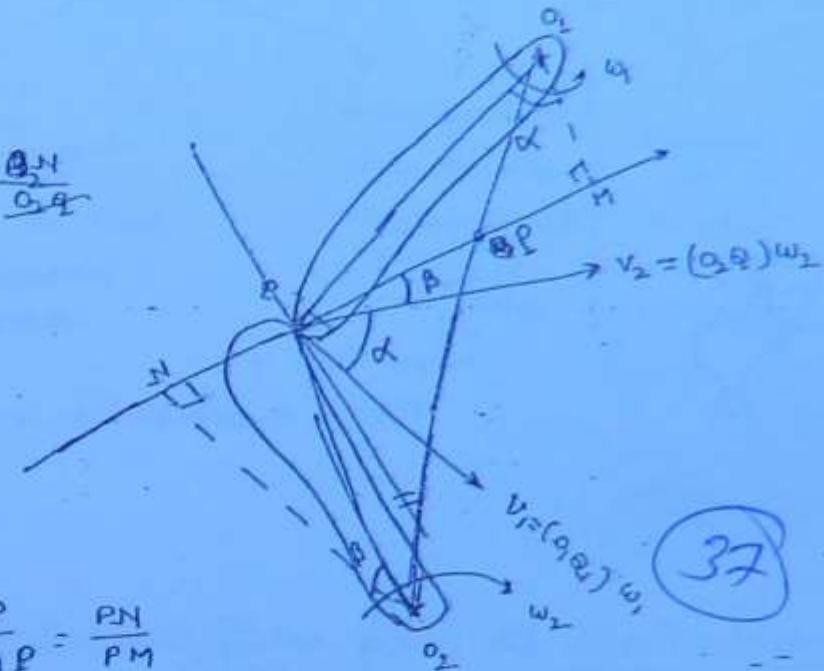

$$(O_1 Q) \omega_1 \cdot \frac{QM}{O_1 M} = (O_2 P) \omega_2 \cdot \frac{QN}{O_2 N}$$

$$\Rightarrow -\frac{Q}{P} \omega_1 \cdot \frac{QM}{O_1 M} = \omega_2 \cdot \frac{QN}{O_2 N}$$

$$\Delta O_1 PM \sim \Delta O_2 PN$$

$$\frac{\omega_1}{\omega_2} = \frac{-O_2 N}{O_1 M}$$

$$\frac{\omega_1}{\omega_2} = \frac{O_2 N}{Q M} = \frac{O_2 P}{Q P} = \frac{PN}{PM}$$

If these bodies are geary

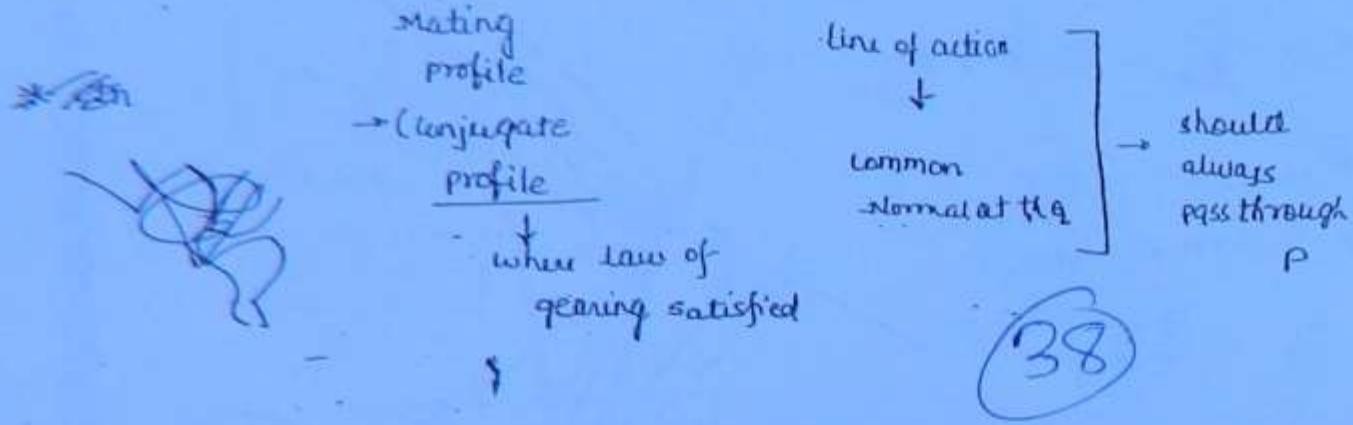

$$\sqrt{\frac{\omega_1}{\omega_2}} = \frac{O_2 N}{O_1 M} = \frac{O_2 P}{Q P} = \frac{PN}{PM} = \text{const.}$$

$$\frac{O_2 P}{Q P} = \text{const.} \Rightarrow P \rightarrow \text{fixed point}$$

$$\begin{aligned} V_{\text{sliding}} &= |V_1 \sin \alpha - V_2 \sin \beta| \\ &= \left| O_1 Q \omega_1 \cdot \frac{QM}{O_1 M} - O_2 P \omega_2 \cdot \frac{QN}{O_2 N} \right| \\ &= | \omega_1 (QP + PN) - \omega_2 (PN - QP) | \\ &= | \omega_1 QP + \omega_2 PM - \omega_2 PN + \omega_1 QP | \end{aligned}$$

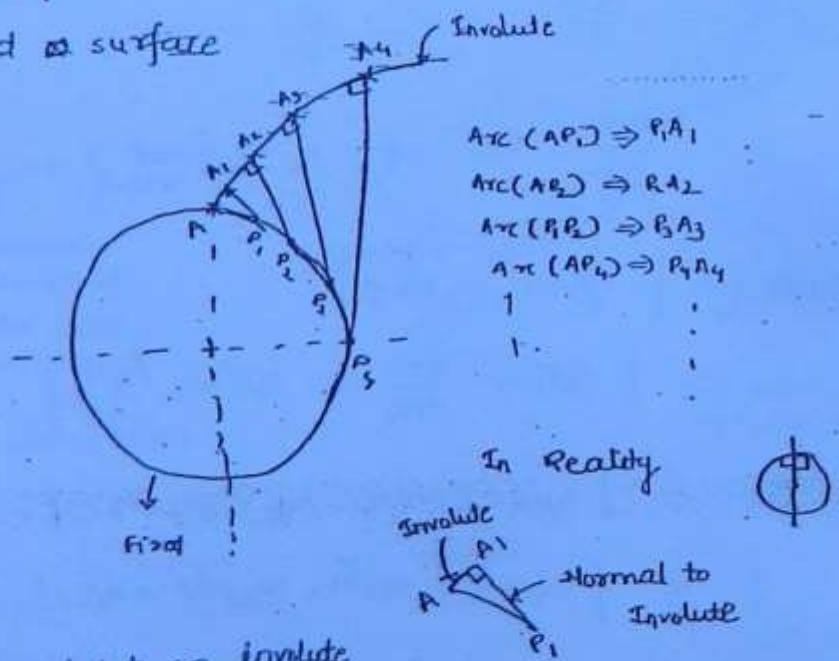

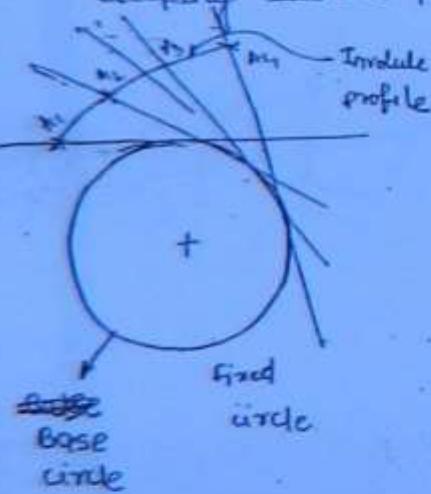

$$V_{\text{sliding}} = (\omega_1 + \omega_2) QP$$

"Common normal at the point of contact between the two mating gear should always pass through a fixed point on the line joining the centres of rotation of the gears and this fixed point is known as pitch point."

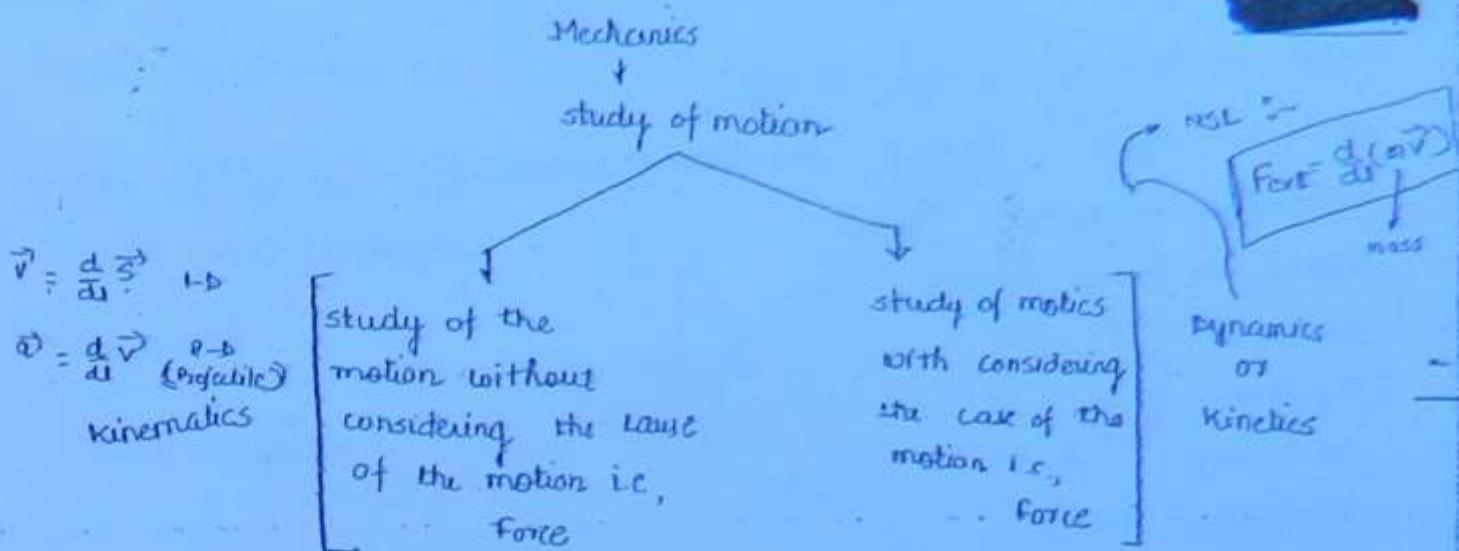

* Involute Profile (By nature conjugated, Pure mathematical curve)

It is a locus of a point on a line which rolls without slipping with a fixed surface  Involute

- * Normal drawn at any point on involute curve will become tangent to its base circle
 - * Involute curve is the combination of very small arc of circles of different having different radius and different centre.

moment of inertia - mass distribution

(39)

mass is the measurement of inertia property
Parameter

mass unit directly / Indirectly - dynamic quantity parameter

kg or N - not present - kinematic parameter

* Classification of Gears :-

29/06/2011

⇒ According to the axis of the shafts connected :-

⇒ When both axes are Parallel:

⇒
Pure rolling motion
if two cylinders in contact

a) Teeth are straight and \parallel to the axis of rotation

\Downarrow
spur gear

- no axial thrust

①

- Impact stress
($> 99.9\%$ failed)

- Since impact stress is present (high), it is noisy.

②

↓

93

b) Teeth are straight but inclined to the axis of rotation

\Downarrow
Helical gear

- Impact is eliminated
- Axial thrust present
- gradual engagement

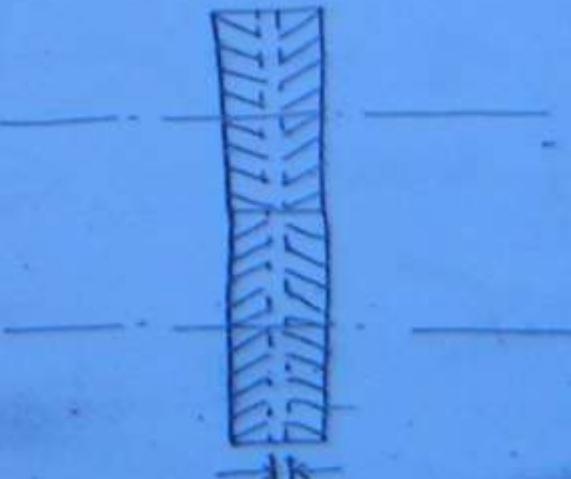

Double helical
to minimise axial thrust

to minimise axial thrust

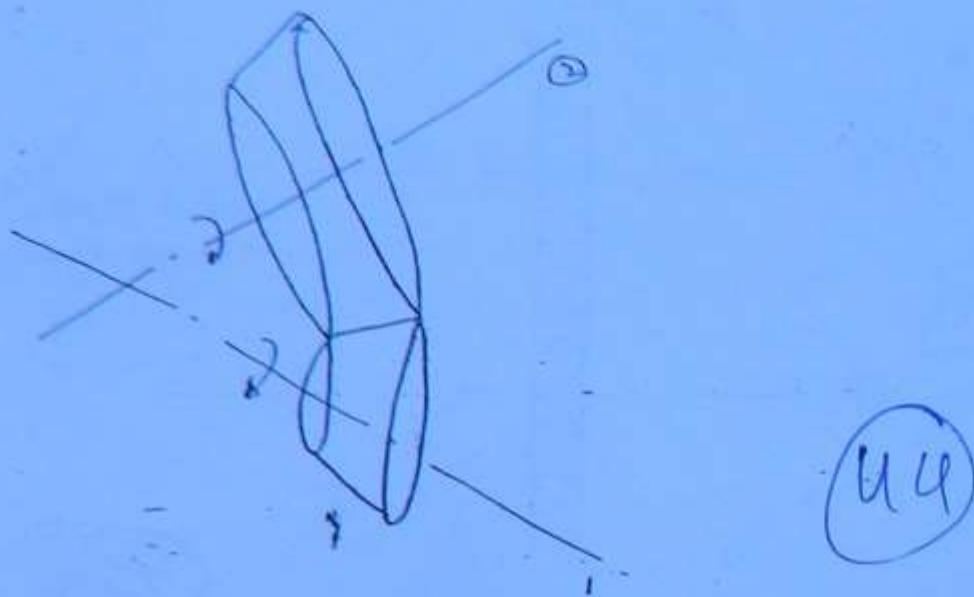

Herringbone gear

Herringbone gear

Applications :-

Q. When both axis are inclined (intersecting) :-

(U4)

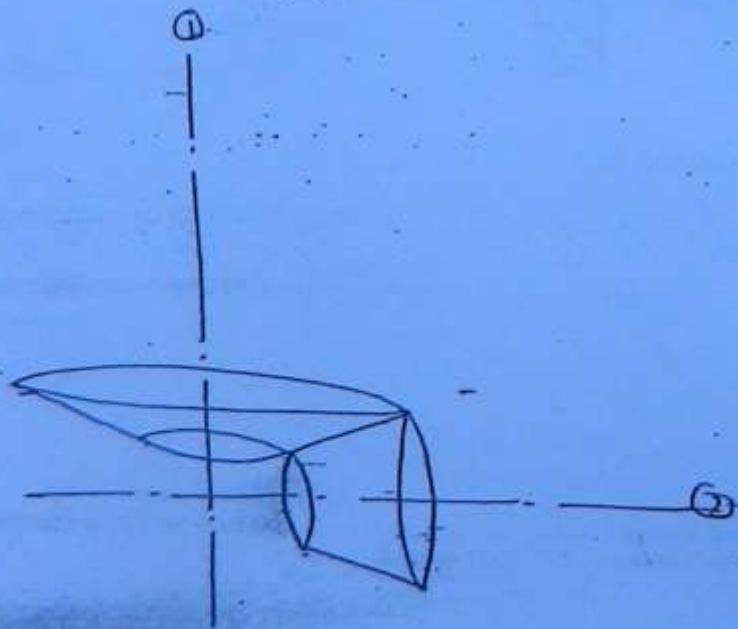

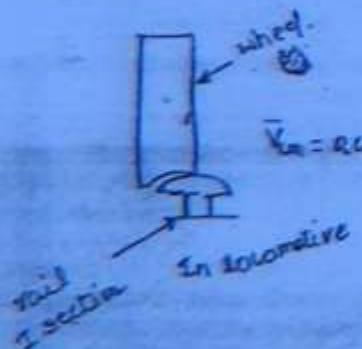

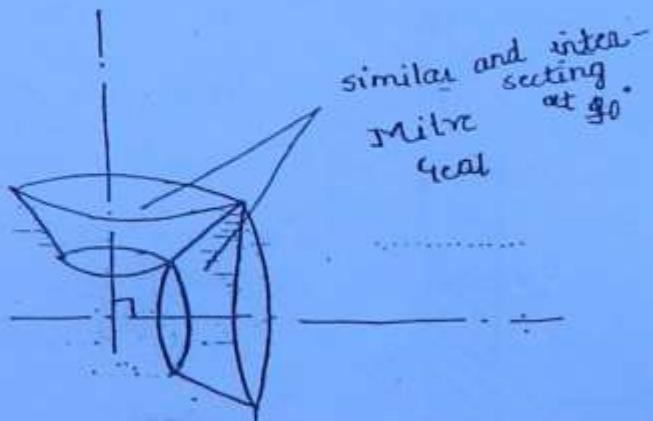

Bevel Gear

- teeth are st. but \perp to the axis of rotation
- ↓
- st. Bevel Gear

→ teeth are st. but inclined to the axis of rotation.

↓

Helical Bevel Gear

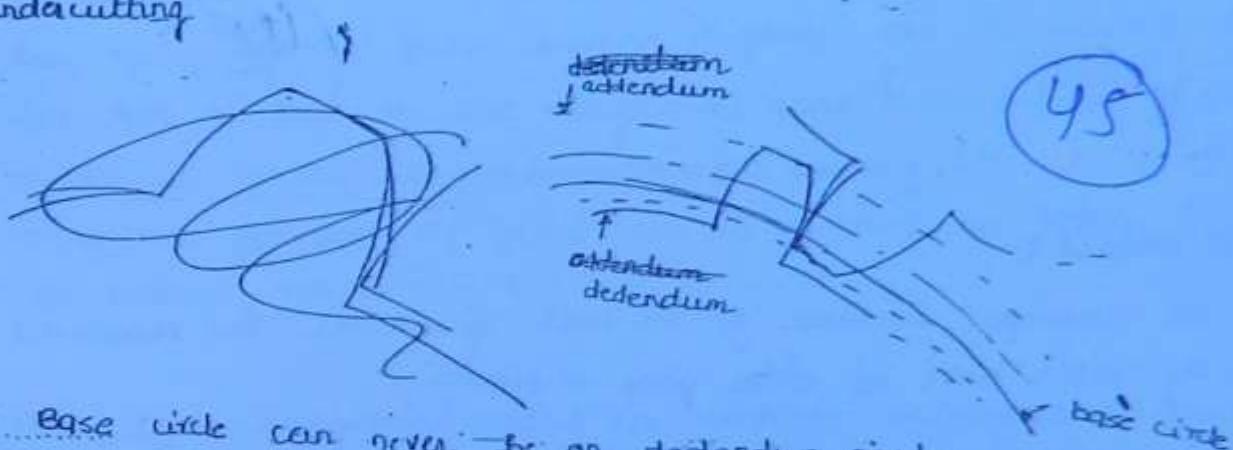

Hyperbola is a curve obtained when the centre is fixed but the radius is changing with negligible amount say α .

1/07/2011

* Analysis of Involute Gear :-

undecutting

* Base circle can never be on dedendum circle.

K → point of Engagement
L → End of Engagement

Line of action :-

1. Pass through (P) Gear.
2. Tangent to both the base circle (Involute)

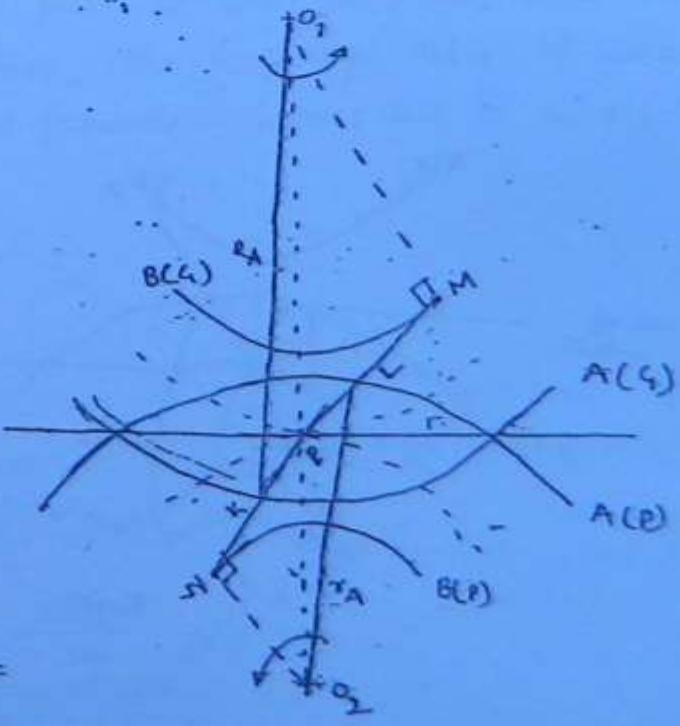

KL - total distance travelled by (Q) from start to end of the engagement.

→ (Path of contact) =

$$KP + PL$$

↓ ↓

Path of approach Path of recess

$\Delta \omega_{KM}$

$$\begin{aligned}\omega_M &= R\omega\cos\delta \\ PM &= R\sin\delta\end{aligned}$$

$$r_A^2 = R^2(\cos^2\delta + (1\text{CP} + R\sin\delta)^2)$$

$$\therefore KP = \sqrt{r_A^2 - R^2\cos^2\delta - R\sin\delta}$$

$$PL = \sqrt{r_A^2 - R^2\cos^2\delta - r\sin\delta}$$

$$KL = KP + PL$$

46

* Arc of contact :-

It is an analogous distance of the path of contact but measured along the pitch circle of either gear or pinion.

Arc of contact

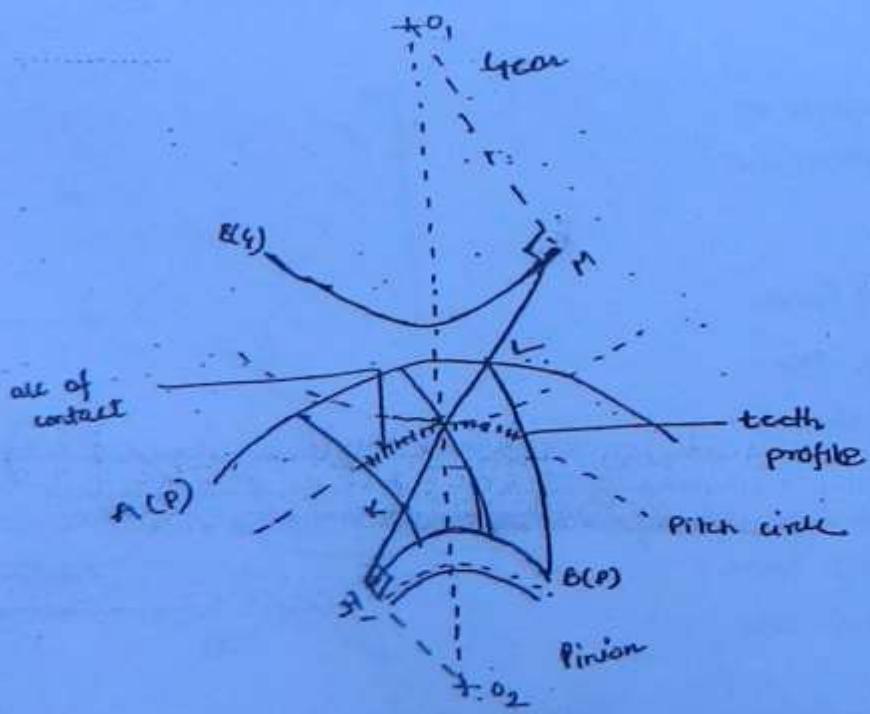

$$= \frac{\text{Path of contact}}{\text{Circumf.}}$$

Arc of add.

$$= \frac{\text{Path of add.}}{\text{Circumf.}}$$

Arc of recess

$$= \frac{\text{Path of recess}}{\text{Circumf.}}$$

For exam:

Arc of contact $\Rightarrow 1\text{PC}, 2\text{PC}$

$$\boxed{\text{Contact Ratio} = \frac{\text{Arc of contact}}{\text{PC}}}$$

↓
No. of Pairs
in contact

if contact ratio = 1.4
justify answer

1.3 - 1.8
min → 1.

* For high power transmission
contact ratio in maz. should
be more

(47)

Ques.

In one engagement zone 1 pair of gears are in contact but for 40% of time in one engagement zone 1 more pair of gears are in contact. At ~~this moment~~ during this 40% of time two ~~gears~~ pair of gears are in contact in total. So, the contact ratio is 1.4

"One pair is engaged in complete engagement period but 40% of time of this engagement period is like that along with this pair 1 more pair i.e., total two pairs are engaged. Therefore, the average value of contact ratio in one engagement period is comes out to be 1.4."

Prob:

$$t = 24$$

$$T = 36$$

$$m = 8\text{mm}$$

$$\text{Addendum} = 7.5\text{mm}$$

Gear

$$R = \frac{mT}{2} = \frac{8 \times 36}{2} = 144\text{mm}$$

$$r_A = 144 + 7.5 = 151.5\text{mm}$$

Pinion:

$$r = \frac{mb}{2} = \frac{8 \times 24}{2} = 96\text{mm}$$

$$T_A = 96 + 7.5 = 103.5 \text{ mm}$$

Path of contact

$$KL = KP + PL$$

$$= \left[\sqrt{R_A^2 - R^2 \cos^2\phi} - R \sin\phi \right] + \left[\sqrt{\overline{r}_A^2 - r^2 \cos^2\phi} - r \sin\phi \right]$$

$$= 18.886 \text{ mm} + 17.9037 \text{ mm}$$

$$= 36.7843 \text{ mm}$$

$$\text{Arc. of contact} = \frac{36.7843}{60 \times 20^\circ} = 39.1450 \text{ mm}$$

$$\text{i)} \frac{39.1450}{96} \times \frac{180}{\pi} = 23.3630^\circ$$

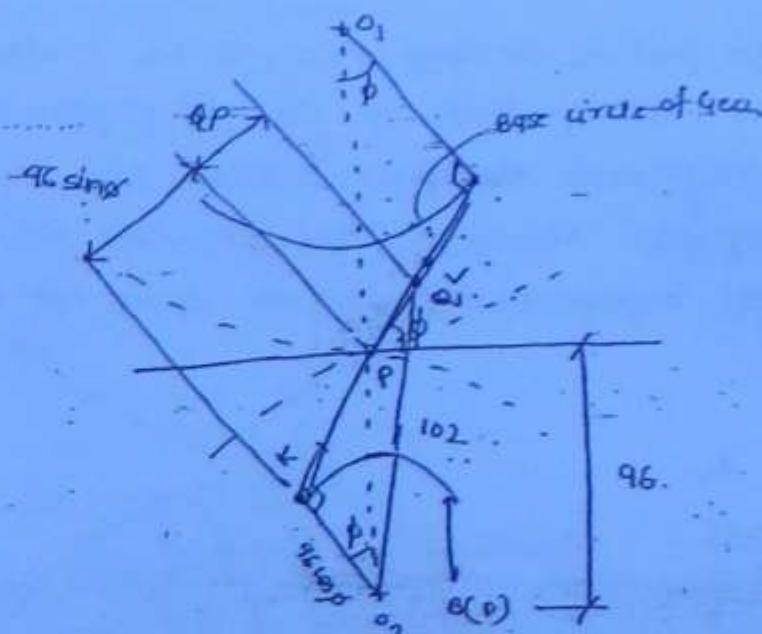

$$\text{ii)} N_p = 450 \text{ rpm}$$

$$\frac{N_s}{N_p} = \frac{r}{R} \quad N_q = 300 \text{ rpm.}$$

$$(102)^2 = (96 \cos 20^\circ)^2 + (96 \sin 20^\circ + QP)^2$$

$$QP = 14.7693 \text{ mm}$$

$$\begin{aligned} V_{\text{sliding}} &= (\omega_1 + \omega_2) QP \\ &= \frac{2\pi}{60} (N_q + N_p) QP \\ &= 1.16 \text{ m/s} \end{aligned}$$

* Interference (Death of Involute Gear) :-

For pinion :-

If $r_A \uparrow \Rightarrow$ it will shift towards M

Till M \rightarrow No problem

If $r_A > r_2 M$

undesirous will happen \rightarrow results in interference

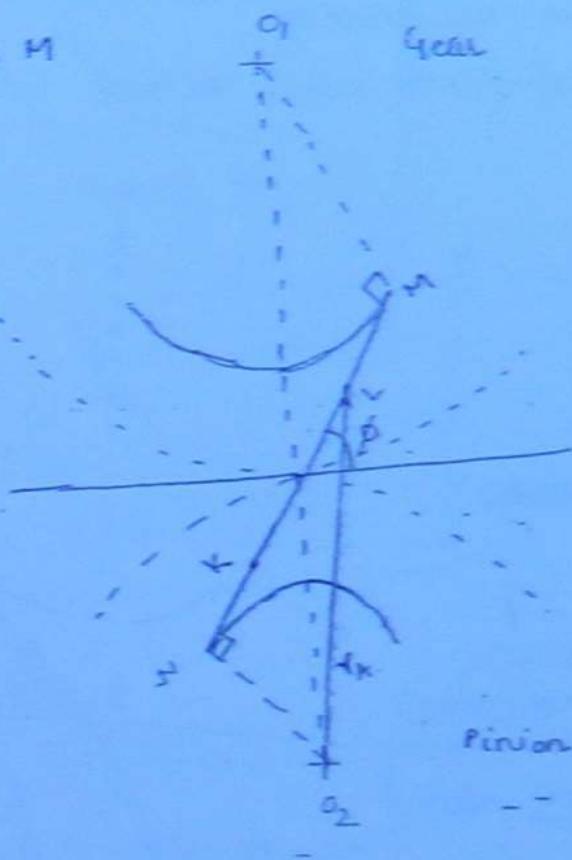

For gear :-

some

if $-R_A > 0.4M$

M] critical point

N] (interference point)

Methods to Prevent interference:

1. Under cut gears :

2. $\phi \uparrow \Rightarrow r_b \downarrow$ radius of base circle.

8. ↑ the no. of Teeth :

If the minimum no. of teeth are increased, the addendum circle radius will decrease.

Clearly ∵ r_A is decreasing
interference will decrease.

$$\frac{T}{t} = \text{Gear ratio} = \frac{R}{r}$$

Biggy
Smaller

Applying law rule to $\triangle O_2 PM$

$\triangle O_2 PM$

$$\begin{aligned} r_h^2 &= r^2 + R^2 \sin^2 \phi - 2r(R \sin \phi) \cdot \\ &\quad \cos(\alpha_0 + \phi) \\ &= r^2 \left[1 + \frac{R^2 + 2rR \sin^2 \phi}{r^2} \right] \\ &= r^2 \left[1 + \frac{R}{r} \left(\frac{R}{r} + 2 \right) \sin^2 \phi \right] \end{aligned}$$

$$r_h^2 = r^2 \left[1 + \alpha(4+2) \sin^2 \phi \right]$$

$$r_h = r \sqrt{1 + \alpha(4+2) \sin^2 \phi}$$

Addendum of

$$\text{pinion} = r_h - r$$

$$= \sqrt{\left[1 + \alpha(4+2) \sin^2 \phi \right] - 1}$$

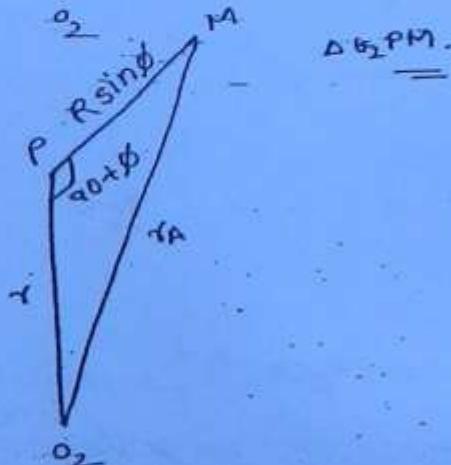

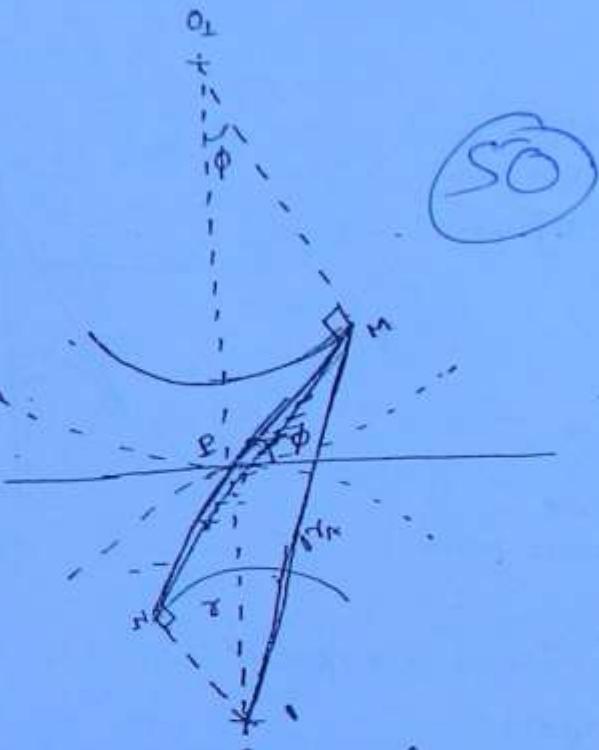

$$= \frac{m_{\text{min}}}{2} \left[\sqrt{1 + \alpha(4+2) \sin^2 \phi} - 1 \right] \quad \text{--- (1)}$$

$a_p \rightarrow$ fractional Addendum of Pinion for one module in order to avoid interference

If module $\Rightarrow m$

$$\text{Addendum of pinion} = m a_p$$

--- (2)

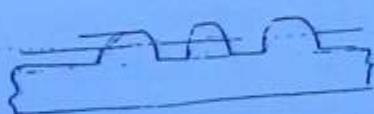

$$m A.P = \frac{mt}{2} \min_{\alpha} \left[\sqrt{1 + G((q+2) \sin^2 \alpha)} - L \right]$$

$$t_{\min} = \frac{2A_p}{\sqrt{1 + q(4+2)\sin^2\alpha} - 1}$$

$$t_{\min} = \frac{2A_q}{\sqrt{1 + \frac{1}{q} \left(\frac{1}{q} + 2 \right) \sin^2 \alpha} - 1}$$

S/1

- * Minimum No. of Teeth on Pinion to avoid interference in Involute Rack and Pinion Arrangement

Addendum rack

$$-4x = \gamma \sin^2 \phi$$

$$= \frac{m t_{\min}}{2} \sin^2 \phi \quad \text{--- (1)}$$

A_R - Fractional addendum of rack for one module in order to avoid interference

If module = m_2

$$\text{Add}(R_{\text{out}}) = m \cdot A_R - ②$$

$$m^* A_R = \frac{\min}{2} \sin^2 \theta_W$$

$$t_{\min} = \frac{2AR}{\sin^2 \alpha}$$

$14\frac{1}{2}^\circ, 20^\circ$

Full depth \rightarrow standard Addendum $\Rightarrow 1m$

$$mA = 1m$$

$$\boxed{A = 1}$$

$\boxed{20^\circ}$, $22^\circ, 25^\circ$

'stub'

Addendum $< 1m$

$$mA < 1m$$

$$\Rightarrow \boxed{A < 1} *$$

generally $0.8 - 0.75$

so 'stub' is said to be Best due to following movement

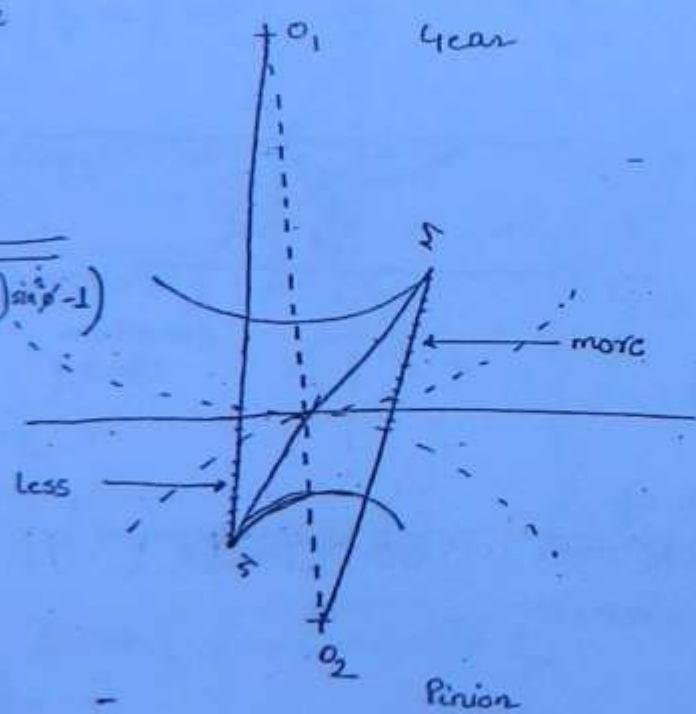

1. stronger teeth }
2. low interference
3. lesser no. of teeth (t_{min}) T_{min}
4. cost is also less. --

Addendum \rightarrow same

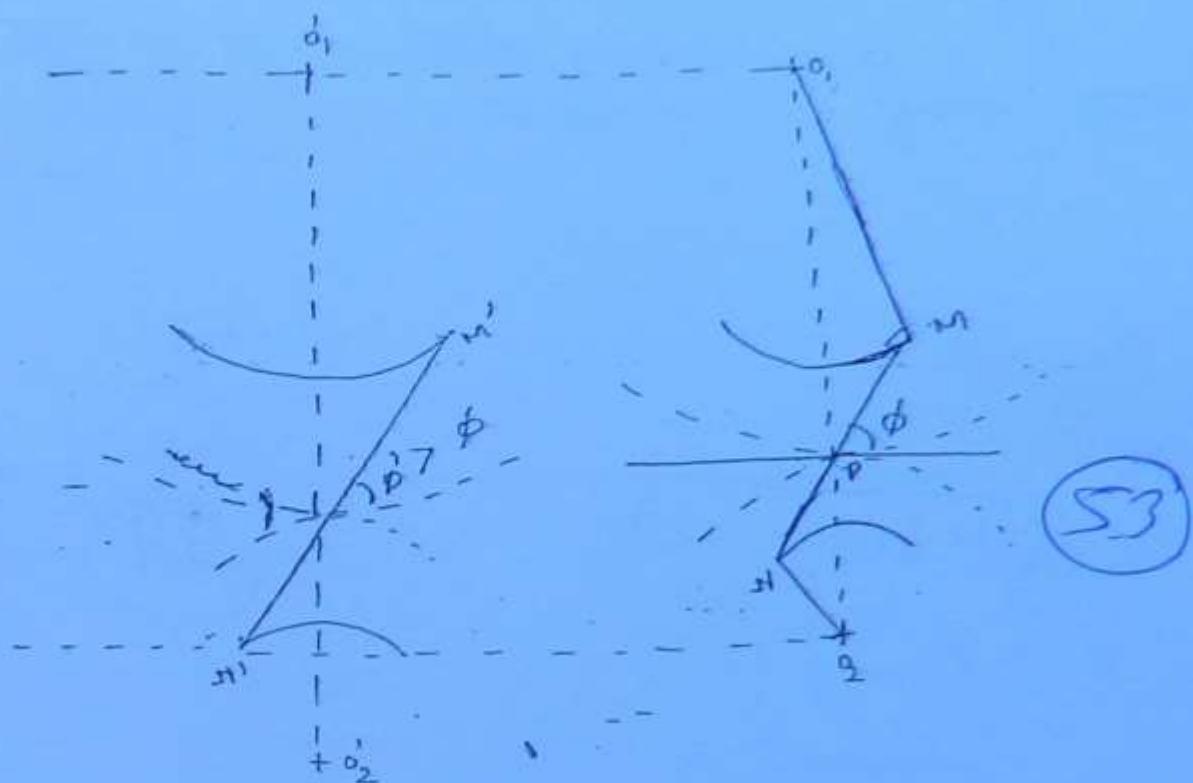

$$t_{min} = ?$$

$$t_{min} = \frac{2A_0}{\sqrt{\left(1 + \frac{1}{c} \left(\frac{1}{c} + 2\right) \sin^2 \beta' - 1\right)}}$$

$$\boxed{t_{min} = \frac{T_{min}}{c}}$$

* Effects of Vibration and Centre Distance on Involute Gear :-

- Its centre distance increases pressure angle increases and its tooth interference will decrease but it is not the correct method to reduce centre distance and vice-versa.
- By changing the centre distance the velocity ratio doesn't change.

2007 - section B. - 3

Ques: 3.

$$a) \quad q = 3$$

$$A_D, A_{q_1} = 1$$

$$\phi = 20^\circ$$

$$t_{\min} = \frac{2A_q}{\left(\sqrt{1 + \frac{1}{q}(\frac{1}{q}+2)\sin^2\phi} - 1 \right)} = 44.9426 \approx 45$$

$$t_{\min} = \frac{45}{3} = 15$$

$$t_{\min} = 12 \Rightarrow t_{\min} = 36.$$

$$36 = \frac{2A_q}{\left(\sqrt{1 + \frac{1}{q} \left(\frac{1}{q} + 2 \right) \sin^2 \phi} - 1 \right)}$$

$$\Rightarrow 2A_q = 0.8$$

$\Rightarrow 20\%$ slubbing

Q. No. 3.

$$T_{min} = 36.$$

$$36 = \frac{2A_q}{\left(\sqrt{1 + \frac{1}{q} \left(\frac{1}{q} + 2 \right)} - 1 \right)}$$

$$\phi = 22.5^\circ$$

(54)

Pb

$$A_p, A_q = 1$$

$$\begin{bmatrix} q = 4 \\ q = 20f \end{bmatrix} T_{min}$$

$$T_{min} = \frac{2A_q}{\left(\sqrt{1 + \frac{1}{q} \left(\frac{1}{q} + 2 \right) \sin^2 \phi} - 1 \right)}$$

$$= 61.77$$

$$T_{min} = \frac{62}{4} = 15.5 \text{ sec. 16}$$

work book (Page 34)

Q. No. 5.

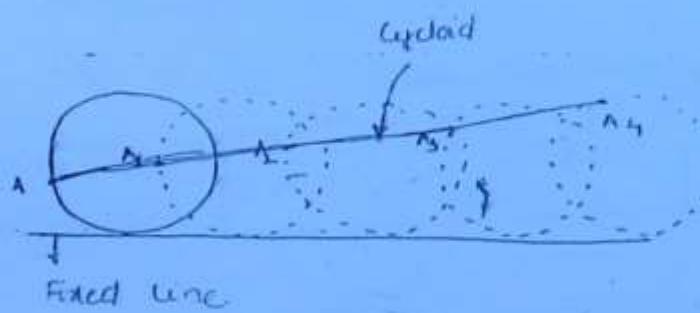

$$\phi = 20^\circ$$

$$m = 16 \text{ mm}$$

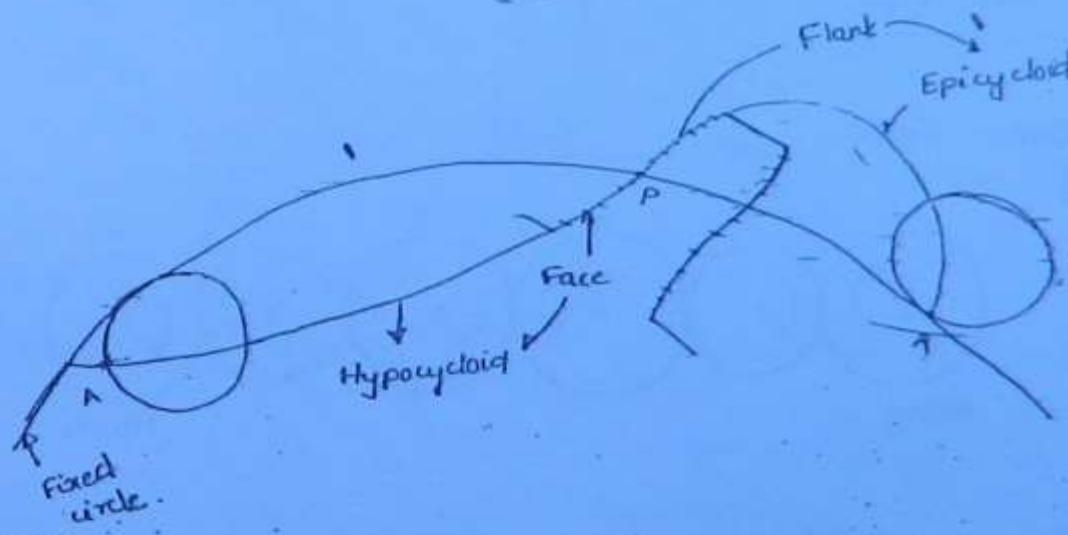

- A_p

* Cycloidal Profile :-

It is the locus of the point on the circumference of the circle which rolls without slipping on a fixed straight line. This profile is also by nature conjugate.

SS

Advantages

1. Per tooth box cost is high but overall cost is low
2. Interference is absent because automatic undercutting is provided due to its nature of profile
3. Flank wide \rightarrow strength more
4. Life more \rightarrow less wear

disadvantage

1. pressure angle (γ) is continuously changing $[m_{\text{min}} - o - m_{\text{max}}]$ ($E_{\text{cos}\gamma}$)
2. severe effect of vibration \rightarrow velocity ratio is changing

Gear Train

combination of gears.

Why combination of gears are required?

- 1. centre distance is large
- 2. centre distance is less but velocity ratio is high i.e., $\frac{\omega_1}{\omega_2} = 10, \frac{1}{10}$] high/ low

→ Three parts of Gear Train :-

1. Main DVR
2. Main DVN
3. Intermediate Gears.

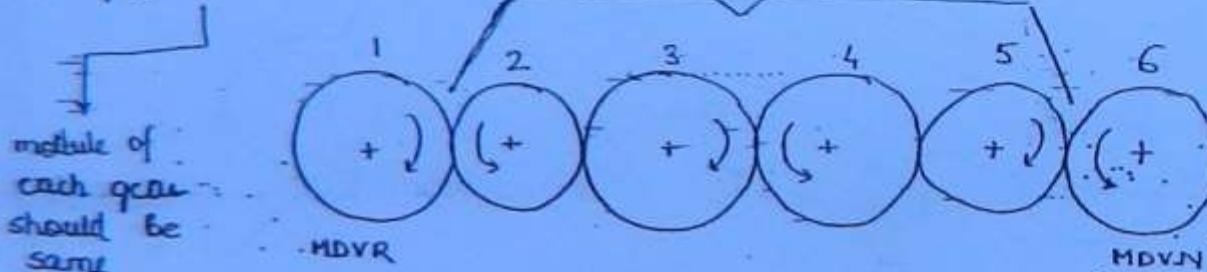

$$\text{Velocity ratio of gear} = \frac{\omega_{\text{DVN}}}{\omega_{\text{DVR}}}$$

$$\text{speed ratio} = \frac{\omega_{\text{main DVR}}}{\omega_{\text{main DVN}}} \\ (\text{Velocity Ratio})$$

$$\left[\frac{1}{\text{s.r.}} = \text{Train Value} \right]$$

56

* Simple Gear Train :

1, 2 :-

$$\frac{\omega_1}{\omega_2} = \frac{T_2}{T_1}$$

⇒ 4, 5 :-

$$\frac{\omega_4}{\omega_5} = \frac{T_5}{T_4}$$

2, 3 :-

$$\frac{\omega_2}{\omega_3} = \frac{T_3}{T_2}$$

S.C. :-

$$\frac{\omega_5}{\omega_6} = \frac{T_6}{T_5}$$

3, 4 :-

$$\frac{\omega_3}{\omega_4} = \frac{T_4}{T_3}$$

All eqⁿ (x)

$$\frac{\omega_1}{\omega_6} = \text{s.r.} = \frac{T_6}{T_1}$$

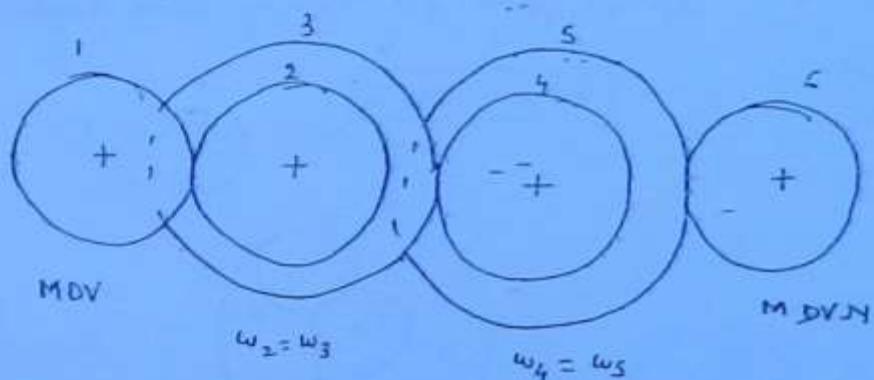

Clearly, from the equation it can be seen that s.r. depends only on MDVR and MDVN. It doesn't depend on intermediate gear. So, these are called idlers.

No. of idlers is odd → direction opposite
No. of idlers is even → direction same

If only one gear is mounted in a shaft in a gear train then it is called Simple Gear Train.

* Compound Gear Train :-

Any of the intermediate shafts if it is having more than one gear in use such a gear train is called compound gear train.
2-3 and 4-5 are compound gears.

$$DVR : (1, 3, 5) \quad m_1 = m_2$$

$$DVR : (2, 4, 6) \quad m_3 = m_4 \\ m_5 = m_6$$

1, 2 :

$$\frac{\omega_1}{\omega_2} = \frac{T_2}{T_1} - ①$$

3, 4 :

$$\frac{\omega_3}{\omega_4} = \frac{T_4}{T_3} - ②$$

5, 6 :

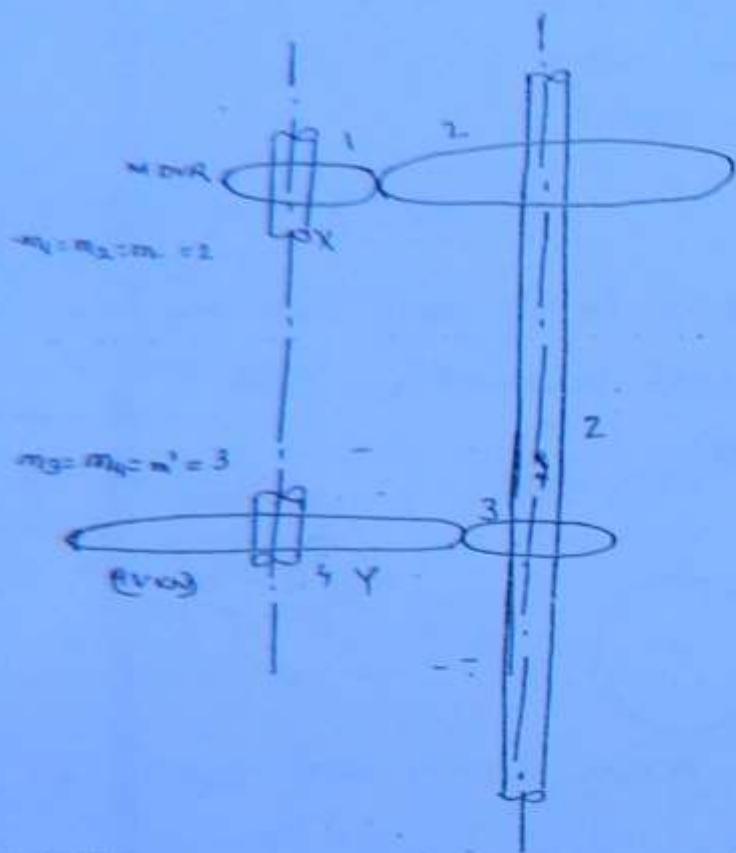

$$\frac{\omega_5}{\omega_6} = \frac{T_6}{T_5} - 3$$

$$S.R. : \frac{\omega_1}{\omega_6} = \frac{T_2 \times T_4 \times T_6}{T_1 \times T_3 \times T_5}$$

$$\therefore S.R. = \frac{\omega_1}{\omega_6} = \frac{\text{Product of No. of Teeth on DVR}}{\text{Product of No. of Teeth on DVR}}$$

* Circumferential Gear Train:

It is a compound gear train in which main driver and main driven shafts are collinear i.e., co-axial.

$$\text{DVR (1,3)}$$

$$\text{D.V.N (2,4)}$$

$$\frac{\omega_1}{\omega_4} = \frac{T_2 \times T_4}{T_1 \times T_3}$$

$$r_1 + r_2 = r_3 + r_4$$

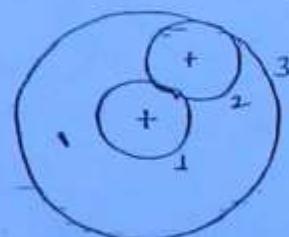

$$\frac{mT_1}{2} + \frac{mT_2}{2} = \frac{mT_3}{2} + \frac{mT_4}{2}$$

$$\boxed{m(T_1 + T_2) = m'(T_3 + T_4)}.$$

If all gears are having same module

$$\boxed{T_1 + T_2 = T_3 + T_4}$$

(58)

$$r_1 + 2r_2 = r_3$$

$$T_1 + 2T_2 = T_3$$

Ques (b)

Problem:-

$$\omega_4 = \frac{\omega_1}{12} \quad \frac{\omega_1}{\omega_4} = 12 \quad = \quad \frac{T_2 \times T_4}{T_3 \times T_3}$$

$$\text{or, } 12 = \frac{T_2 \times T_4}{T_3 \times 24} \quad [T_1 = T_3 = 24]$$

$$T_2 \cdot T_4 = 12 \times 24 \times 24$$

$$- 2(r_4 + r_2) = 3(r_4 + T_4) \quad - \quad ②$$

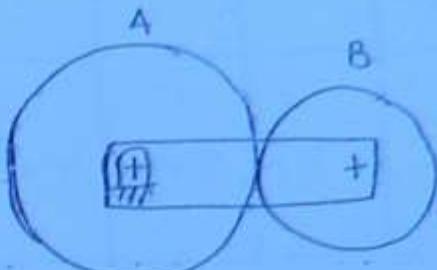

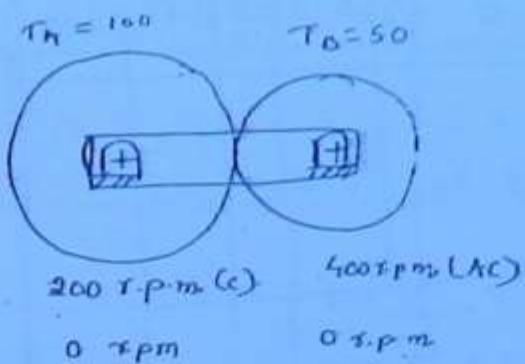

Solving eqn ① & ②

$$\begin{bmatrix} T_4 = 64 \\ T_2 = 108 \end{bmatrix}$$

$$\begin{aligned} (r_1 + r_2) &= \frac{m}{2} (r_1 + r_2) \\ &= \frac{m}{2} (r_4 + T_4) \\ &= 192 \text{ mm} \end{aligned}$$

* Epicyclic Gear Train
rotation
axis

(best)
(space \rightarrow less)

axis ~~axis~~ will rotate
and it is epicyclic.

$$\frac{N_A}{N_B} = \frac{T_B}{T_A}$$

$$N_A = \frac{T_B \cdot N_B}{T_A}$$

$$3 \xrightarrow{-x} 4$$

$$+ \frac{2 \times T_3}{T_4}$$

Problem :-

A-B compound.

All gears are having same module.

$$T_A = 20$$

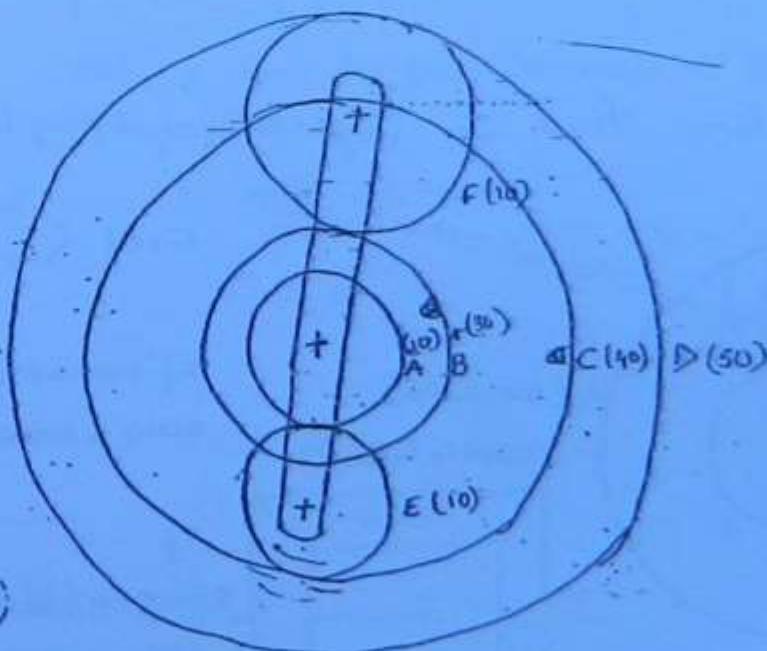

$$T_B = 30$$

$$T_E = T_F = 10.$$

$$\text{i)} N_D = 0$$

$$\text{ii)} N_{arm} = 200 \text{ r.p.m. (AC)}$$

Final N of all other gears

motion	Arm	C 40	E 30	A/B 30/30	F 10	D 50
1. Arm fixed Gear C rotates $+x$ rev (clock)	0	$+x$	$+ \frac{3 \times 40}{40}$	$-4x \times \frac{10}{26}$	$+2x \frac{30}{10}$	$+6x \times \frac{10}{5}$
2. Arm free	Y	$y+3$	$y+4x$	$y-2x$	$y+6x$	$y+\frac{6x}{5}$

$$\text{Now, } y + \frac{6x}{5} = 0$$

$$T_A + 2T_E = T_C$$

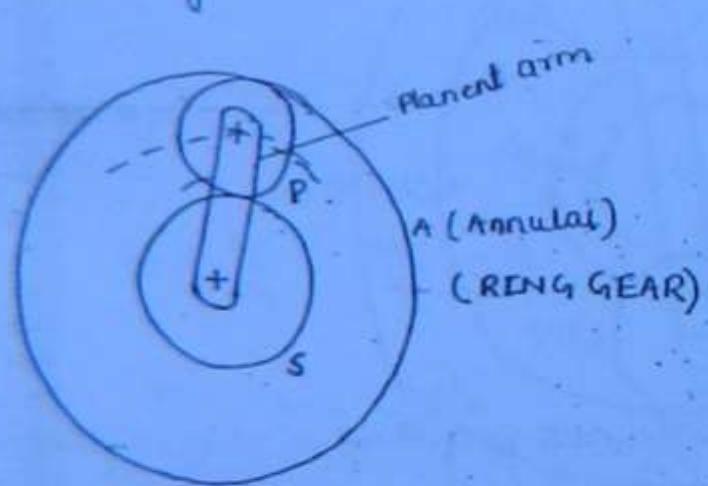

$$T_B + 2T_F = T_D$$

$$y = -200 \text{ rpm}$$

$$x = \frac{200 \times 5}{6} = \frac{1000}{6} = 166.667 \text{ rpm}$$

$F_{s1} \rightarrow$ same $S \rightarrow$ New

$$F_{s1} = x_i \times S$$

Same

(71)

* Stability of Governor :-

A governor is said to be in stable equilibrium if

if every equilibrium speed is having its unique radius and every equilibrium radius is having its unique equilibrium speed.

Friction \rightarrow zero

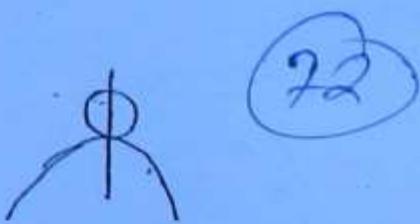

if the restoring forces should be quite dominant as compared to disturbing forces.

$$\Rightarrow \begin{cases} r_1 \Rightarrow N_1 \\ r_2 \Rightarrow N_2 \end{cases} \quad \text{stable Eq}^m$$

* Unstability of Governor

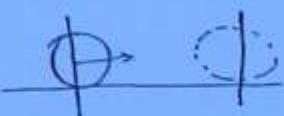

$$\Rightarrow \begin{cases} r_1 \Rightarrow N_1 \\ r_2 \Rightarrow N_2 \end{cases} \quad \text{Unstable Eq}^m$$

22

* Isochronism in Governor

$$\Rightarrow \begin{cases} r_1 \\ r_2 \end{cases} \Rightarrow N = \text{const.}$$

Neutral
Equilibrium

Isochronous
Gov.

* Sensitivity of the Governor :-

For Steepe Movement

$$\text{sensitivity} \propto \frac{1}{N_1 - N_2}$$

$$\boxed{\text{sensitivity} = \frac{N}{r_1 - r_2}} \quad (N = \frac{N_1 + N_2}{2})$$

$$\frac{N_1 - N_2}{N}$$

↳ sensitivity of gov.
↳ performance of engine

Note: Sensitivity and the stability both are inverse property.

* Hunting :- (Governor and system both will die).

It is an extreme problematic situation with excessively high sensitive governor.

The very fast movement of the sleeve between the stoppers is known as Hunting. 73

If the governor ~~sensitivity~~ sensitivity is beyond the certain limit for the slight movement of the load of the engine, then slight ~~increase~~ increase of speed of engine and governor. Immediately the sleeve is going to hit top stopper. Throttle valve fully closed.

Fuel injection totally cut off and speed of the engine and gov. will drastically decrease. Right at the same

speed sleeve is going to sleeve to hit ^{bottom} bottom stopper. Throttle valve fully open with faster speed and throttle will be fully open fuel injection drastically increase and speed of engine will drastically

increase, this phenomena will be repeated thereafter until and unless the stopper will be out of order. The system ~~of~~ will be out of control of governor.

till the movement stoppers are there big vibration and fluctuation of speed will be introduced which damaged other parts of the system.

* Isochronism :-

A governor is said to be an isochronous governor excluding friction if the sleeve is moving and the radius of rotation ~~of~~ is changing but the equilibrium speed is not changing.

$$\begin{matrix} r \uparrow \\ r \downarrow \end{matrix} \Rightarrow N_{eqm} = \text{const.}$$

$$\boxed{\text{sensitivity} = \infty}$$

Condition : $f = 0$

$$f_1 \cdot a = -\frac{Mg + f_{S1}}{2} \cdot b \quad \text{--- (1)}$$

$$f_2 \cdot a = \frac{Mg + f_{S2}}{2} \cdot b \quad \text{--- (2)}$$

$$\frac{f_1}{f_2} = \frac{Mg + f_{S1}}{Mg + f_{S2}}$$

$$\frac{m_1 \omega_1^2}{m_2 \omega_2^2} = \frac{Mg + f_{S1}}{Mg + f_{S2}}$$

for Isochronism: $\omega_1 = \omega_2$

$$\boxed{\frac{\omega_1}{\omega_2} = \frac{Mg + f_{S1}}{Mg + f_{S2}}} \quad \left. \right\}$$

(34)

Isochronous gov't are not used for the practical purposes because friction bet'n the sleeve and spindle can't be zero.

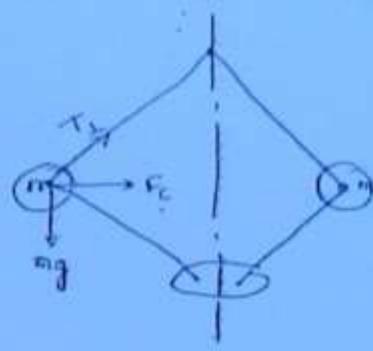

i.e., the condition of Isochronism can only be achieved at the expense of ^{stability} sensitivity. Yes

- bearing stability will always give Isochronism. No.

* Controlling force diagram:-

In every Governor the balls are in continuous rotation. Therefore, the force which is controlling the balls in rotation i.e., centripetal force towards the centre along the radius is known as Controlling Force. Its value is $\frac{mv^2}{r}$ or $m r \omega^2$.

Watt

Practical / Practical

(m_1) , (M_2)

$$F_c = m \cdot r \omega^2$$

$$\omega^2 = \frac{F_c}{m \cdot r}$$

Spring control

(m_1) , (M_2) , (F_s)

$$\left(\frac{2\pi N}{60} \right)^2 = \frac{F_c}{m \cdot r}$$

$$N^2 = \frac{60}{2\pi} \cdot \frac{1}{m} \cdot \frac{F_c}{r}$$

$$N = \frac{60}{2\pi fm} \sqrt{\frac{F_c}{r}}$$

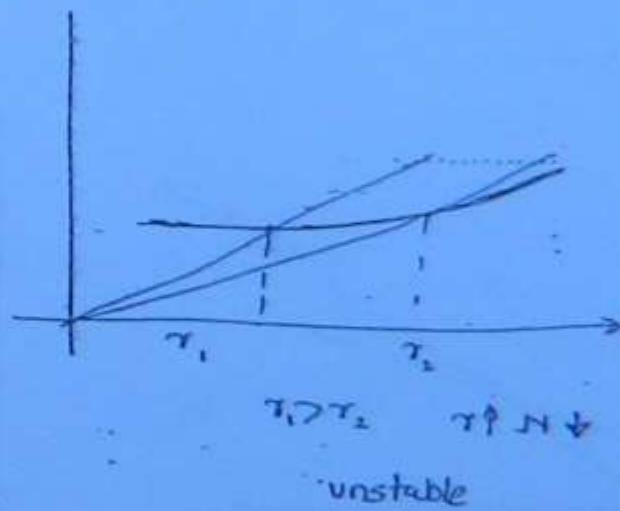

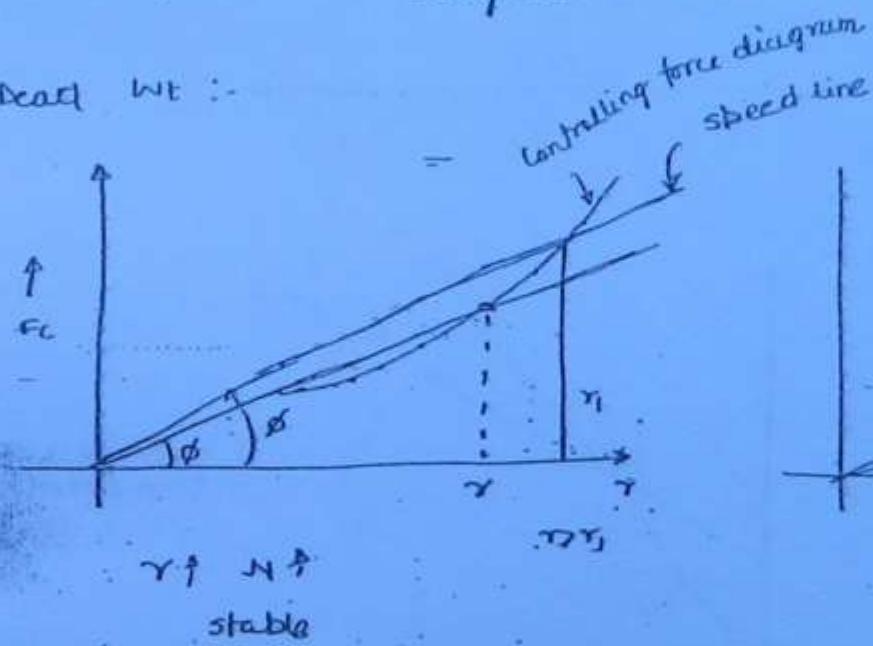

75

$$F_c = m \cdot r \cdot \omega^2$$

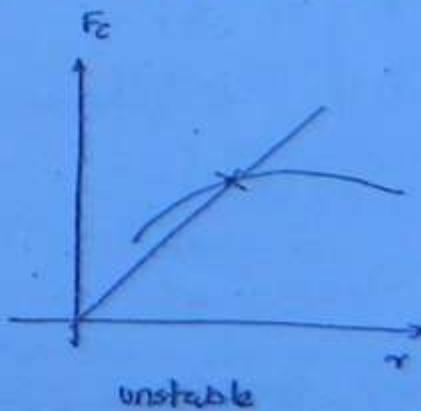

$\frac{(F_c - h)}{J} \rightarrow$ controlling force diagram

$$N = \text{const.} \sqrt{\frac{F_c}{r}} = \text{const.} \sqrt{\tan \phi}$$

Dead wt :-

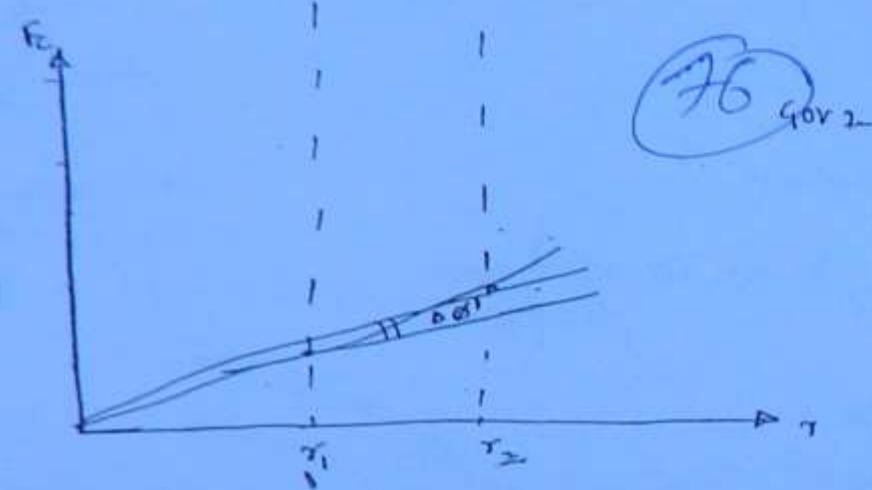

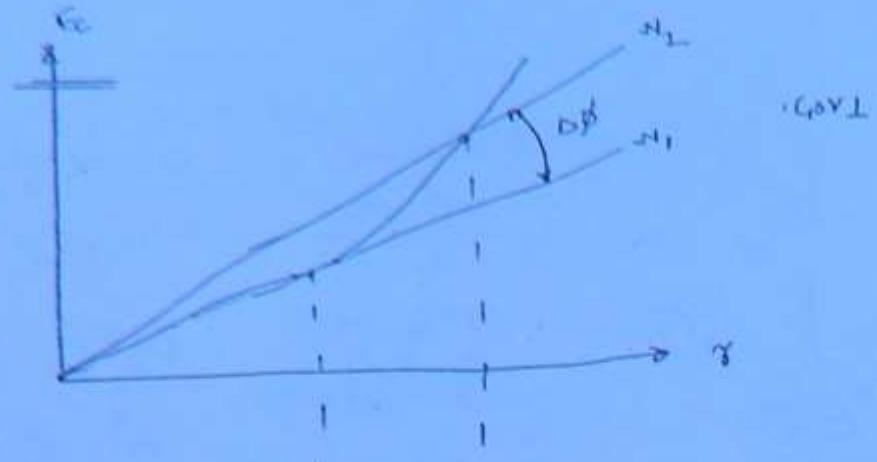

- The slope of controlling force diagram should be $>$ the speed line slope for stability.

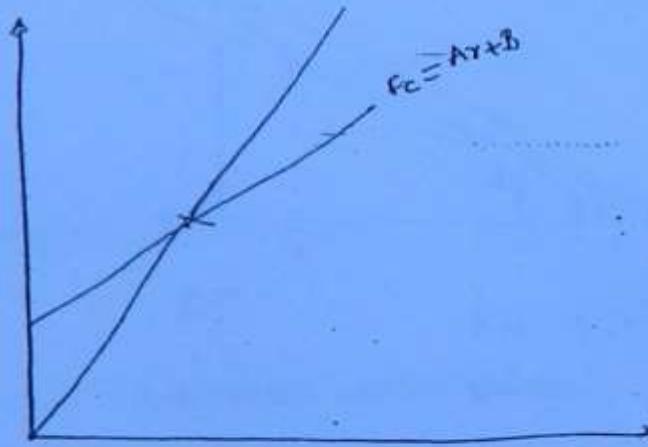

For the same sleeve movement, less speed is required. The governor is sensitive.

If a governor is highly sensitive less stable.

speed less $\rightarrow \Delta\phi$ will be less.

SPRING CONTROL:-

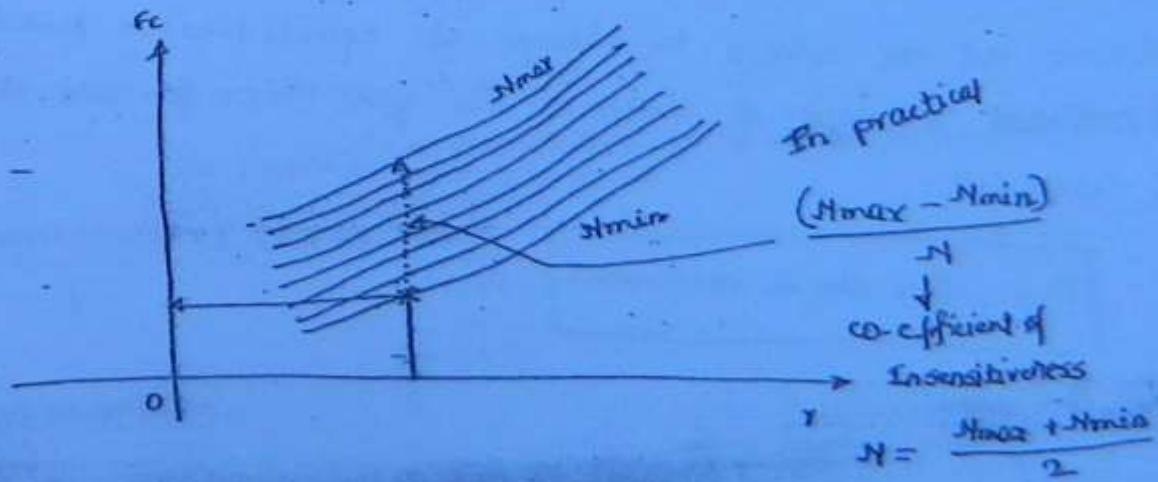

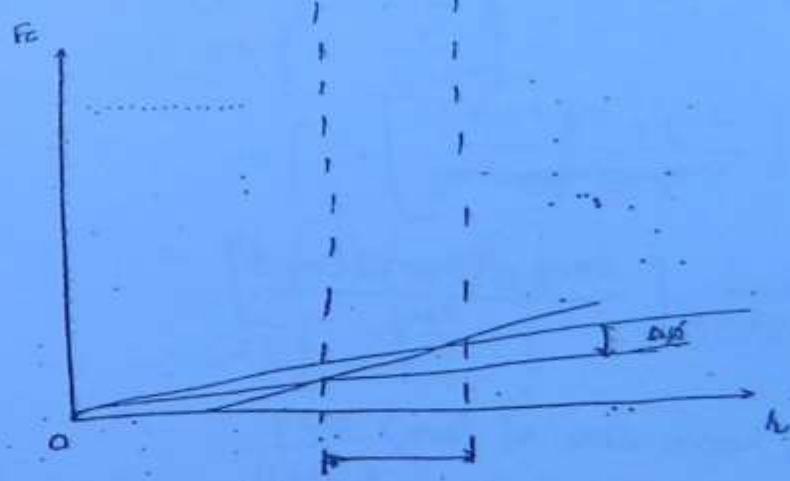

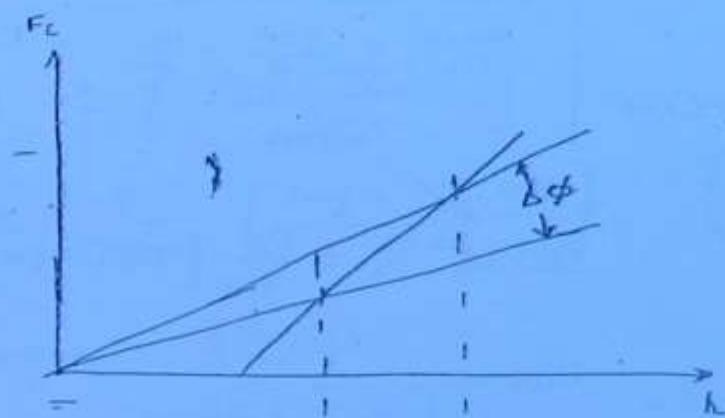

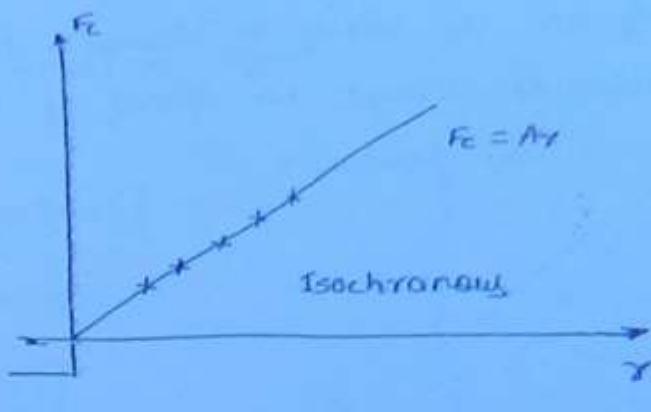

$$f_c = Ar - B \quad \left| \begin{array}{l} r_1 \downarrow \\ \frac{B}{A} \downarrow \\ \therefore (A - \frac{B}{A}) \uparrow \end{array} \right.$$

$$\left(\frac{E}{M} \right) \uparrow$$

$$\Rightarrow \tan \phi \uparrow$$

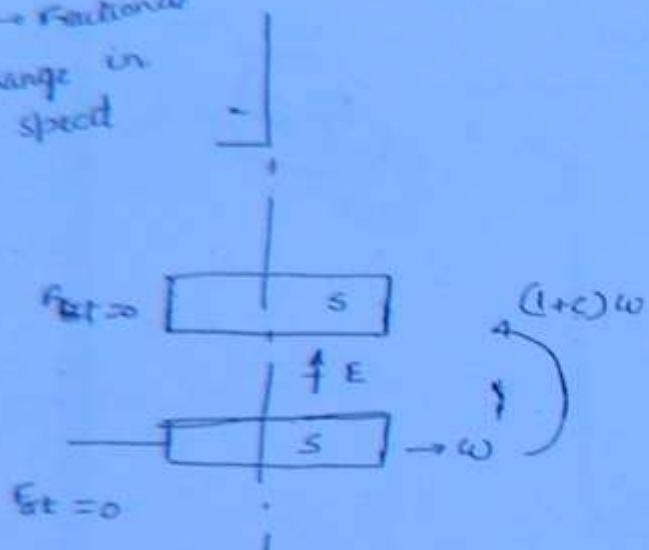

$$\Rightarrow M \uparrow$$

* Effort of the Governor :-

The mean force acting on the sleeve to change its equilibrium position for the fractional change in speed of the governor is known as effort of the governor.

$c \rightarrow$ Fractional
change in
speed

78

Mean Force on the

$$\text{Sleeve} = \frac{0+E}{2} = \frac{E}{2} \rightarrow \text{Effort}$$

Effort.

$$\text{Porter: } \frac{E}{2} = \frac{Cg}{I+K} [2m + M(1+R)]$$

Hartnell :-

$$\frac{E}{2} = C(mg + F_s)$$

$$E = \frac{g}{\omega^2} \left[\frac{2mg + Mg(1+k)}{2mg + (mg + E)(1+c)} \right]$$

$$E = \frac{g}{(1+g^2)\omega^2} \left[\frac{2mg + (mg + E)(1+c)}{2mg} \right]$$

* Power of Governor :- (Work done of Gov)

The workdone at the sleeve to change its equilibrium position for the fractional change $\frac{\Delta}{\omega}$ in speed of the gov. is known as Power of Governor.

$P = \frac{E}{2} \times \text{sleeve movement}$

Postal Governor all arms are equal

$$\therefore R=1$$

$$\frac{E}{2} = \frac{cg}{m+M} [2m + M(1+I)]$$

$$= \frac{cg}{2} \times 2(m+M)$$

$$\boxed{\frac{E}{2} = cg(m+M)}$$

$$\omega \rightarrow h = \frac{g}{\omega^2} \left[\frac{2mg + Mg(1+I)}{2mg} \right]$$

$$(1+c)\omega \rightarrow h_1 = \frac{g}{(1+c)^2 \omega^2} \left[\frac{2mg + Mg(1+I)}{2mg} \right]$$

$$\text{steere movement} = 2(h - h_1)$$

$$= 2R \left(1 - \frac{h_1}{R} \right)$$

$$= 2h \left(1 - \frac{1}{(1+c)^2} \right)$$

$$= 2h \left[1 - \frac{1}{1+c^2+2c} \right]$$

$$= 2h \left[1 - \frac{1}{1+2c} \right]$$

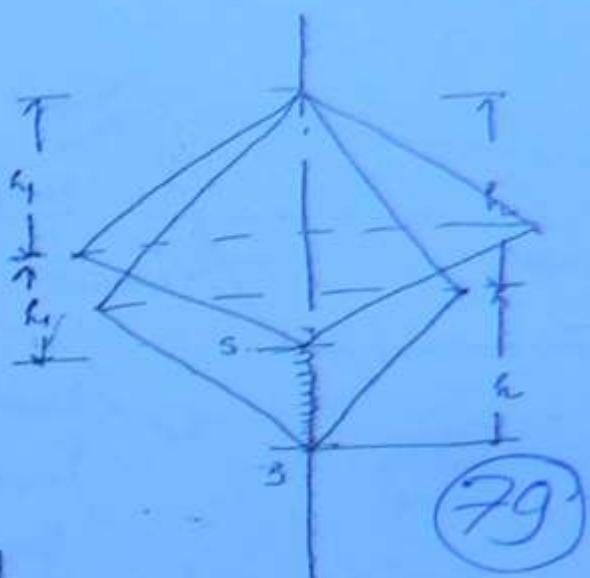

$$= 2h \left[\frac{1+2c-1}{1+2c} \right]$$

$$= \frac{4h \cdot c}{(1+2c)}$$

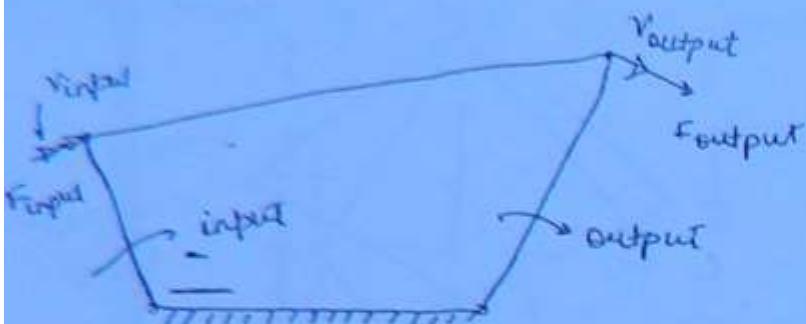

$$P = \frac{E}{2} \times \text{steere movement}$$

$$= cg(m+M) \cdot \frac{4h \cdot c}{1+2c}$$

$$= gh(m+M) \cdot \frac{4c^2}{1+2c}$$

* Mechanical Advantage of the Mechanism :-

$$M.A. = \frac{F_{\text{output}}}{F_{\text{input}}}$$

$$\bullet \quad = \frac{T_{\text{output}}}{T_{\text{input}}} \quad \left. \right\}$$

Ideal:

$$\eta_{\text{mechanism}} = 100\%$$

$$F_{\text{inp}} \cdot V_{\text{inp}} = F_{\text{out}} \cdot V_{\text{out}}$$

$$\frac{F_{\text{out}}}{F_{\text{inp}}} = \frac{V_{\text{inp}}}{V_{\text{out}}}$$

(86)

~~$$M.A. = \frac{V_{\text{input}}}{V_{\text{output}}} \times \eta_{\text{mechanism}}$$~~

$$M.A. = \frac{\omega_{\text{input}}}{\omega_{\text{output}}} \times \eta_{\text{mechanism}}$$

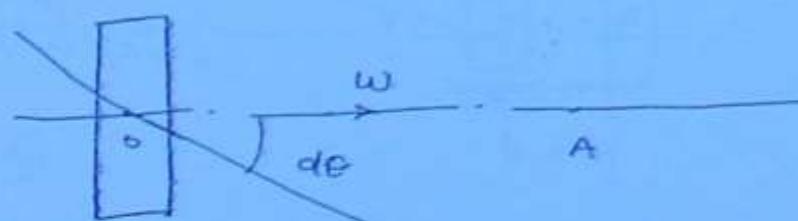

$$\omega_{\text{input}} = \omega$$

$$\omega_{\text{output}} = 0$$

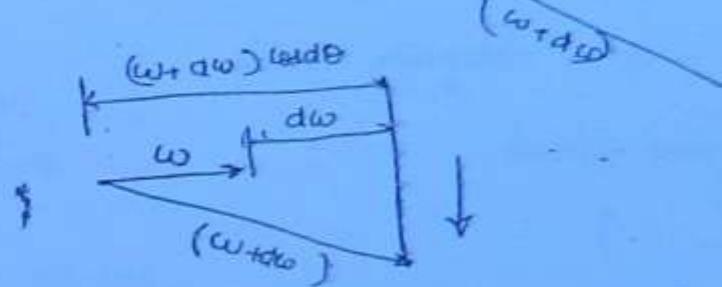

$$M.A. = \frac{\omega}{0} = \infty$$

Along OA

$$\sqrt{n^2 - \sin^2 \theta}, \quad \omega_{CR} = \frac{\cos \theta}{n} \cdot \omega$$

$$\omega_{CR} = \frac{\omega \cos \theta}{\sqrt{n^2 - \sin^2 \theta}}$$

n is length

$$\omega_{CR(\text{approx})} = \frac{\omega \cos \theta}{n}$$

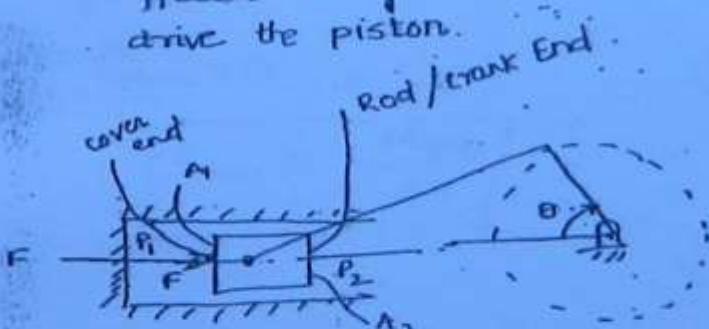

$$\alpha_{CR(\text{approx})} = -\frac{\omega^2 \sin \theta}{n}$$

83

* Dynamic Analysis of Single Slider Crank Mechanism :-

1. Piston Effort

Effective driving force to drive the piston.

$$A_1 = \frac{\pi}{4} D^2$$

$$A_2 = \frac{\pi}{4} (D^2 - d^2)$$

$$F_{gas} = (P_1 A_1 + P_2 A_2)$$

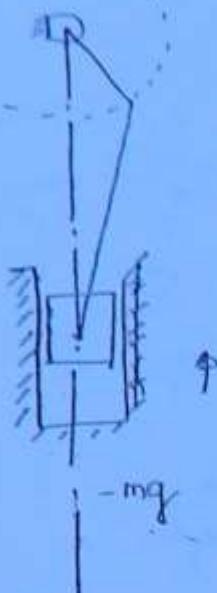

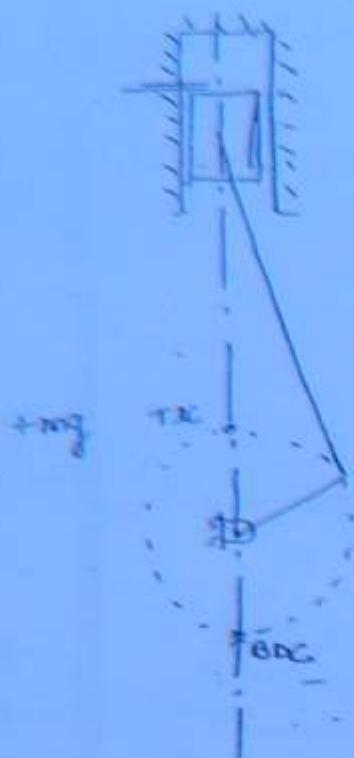

$$F = (F_{gas} - F_I - f) \cdot a$$

If it is a case of vertical engine

$$F = (F_{gas} - F_I - f) \pm mg.$$

$$F_I = m \cdot a \\ = m \cdot r \cdot \omega^2 \left[\cos \theta + \frac{\cos 2\theta}{n} \right]$$

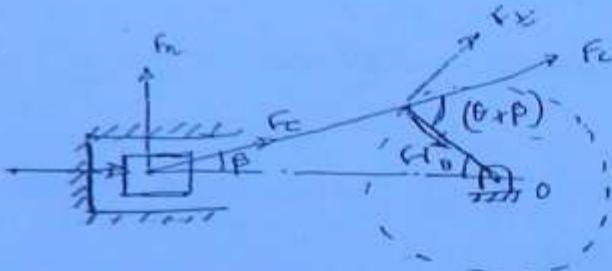

$i > f$

(84)

2. Force Along C.R.

$$F_{c \cos \beta} = F \Rightarrow F_c = \frac{F}{\cos \beta}$$

3. Normal thrust to w.r.t. walls:

$$\omega = \omega_0 + \alpha t$$

$$F_n = F_c \cdot \sin \beta \Rightarrow F \tan \beta$$

4. Crank effort:

$$F_t = F_c \sin (\theta + \beta) = \frac{F}{\cos \beta} \cdot \sin (\theta + \beta)$$

5. Radial thrust to crank shaft Bearings:

$$F_r = F_c \cos (\theta + \beta)$$

$$F_r = \frac{F}{\cos \beta} \cdot \cos (\theta + \beta)$$

c. Turning Moment on Crank shaft :-

$$T = F_t \cdot r = \frac{F}{\cos \beta} \cdot \sin (\theta + \beta) \cdot r$$

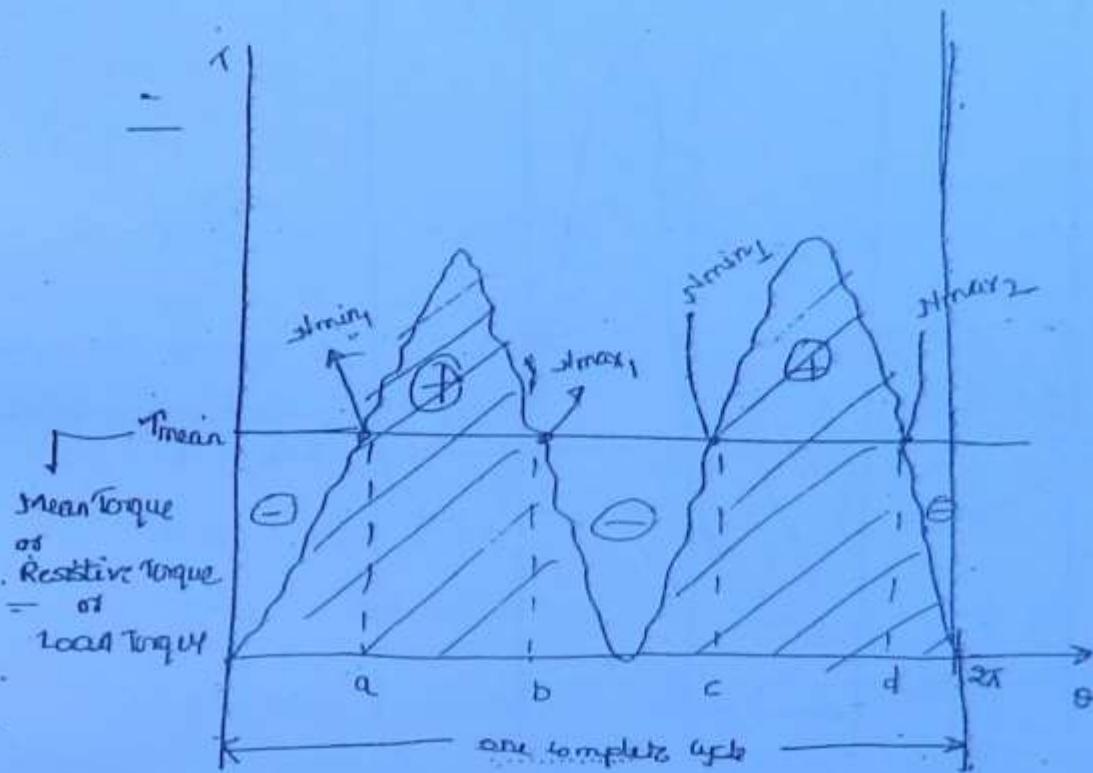

$$T = f(\theta) \quad i.e., T = f_n(t \text{ time})$$

$$I \ddot{\theta} = f_a(t \text{ time})$$

$$\ddot{\theta} = f(t \text{ time}) \rightarrow juk.$$

Mechanism Fly wheel

* Turning Moment Diagram of Single Cylinder Double acting steam Engine :

Wcycle \Rightarrow area under (T-θ) Diagram

$$T_{\text{mean}} \times 2\pi = W_{\text{cycle}}$$

$$T_{\text{mean}} = \frac{W_{\text{cycle}}}{2\pi}$$

$$\min(N_{\text{min}}, H_{\text{min}}, \dots)$$

$$N_{\text{min}}$$

$$\max(H_{\text{max}}, H_{\text{max}2}, \dots)$$

$$N_{\text{max}}$$

$$(N_{\text{max}} - N_{\text{min}})$$

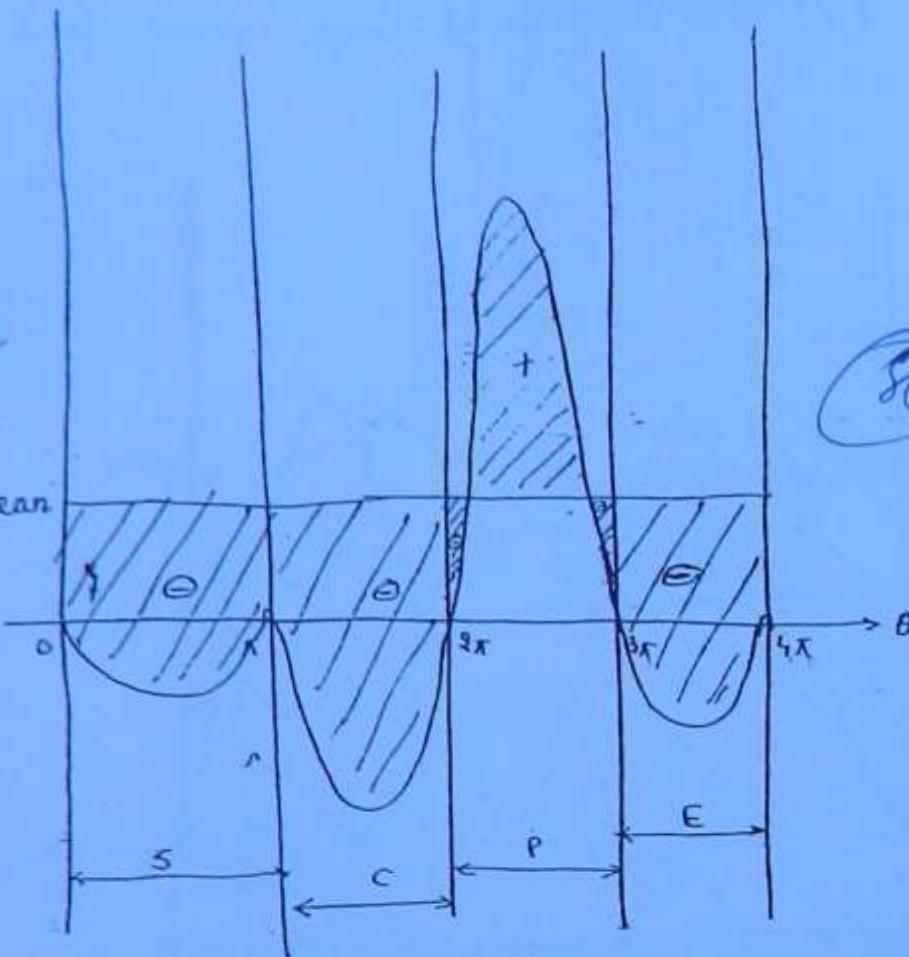

Normally the flywheels are bigger (heavier) in slow speed running engine and they are comparatively lighter in a high speed ~~eng~~ running engine.

* Turning Moment Diagram of Single Cylinder 4-stroke I.C. engine :-

$$\frac{T_{cycle}}{4K} = T_{mean}$$

The turning moment diagram of suction and exhaust are differential positive due to valve action.

$$\rightarrow T_{mean}$$

(86)

* Co-efficient of fluctuation of speed for the flywheel :-

$$\zeta = \frac{N_{max} - N_{min}}{N}$$

$$N = \frac{N_{max} + N_{min}}{2}$$

$$3\% \rightarrow 0.03$$

$$5\% \rightarrow 0.05$$

$$\pm 5\% \rightarrow 10\% \Rightarrow 0.10$$

$$\pm 3\% \rightarrow 6\% \Rightarrow 0.06$$

* Co-efficient of steadiness of speed for the flywheel.

$$\frac{1}{C_3}$$

* Co-efficient of fluctuation of energy of the flywheel :-

Maximum fluctuation = Variation

$$C_E = \frac{E_{\max} - E_{\min}}{W_{\text{cycle}}}$$

* Fundamental Equation of the flywheel :-

m → mass of flywheel

K → Radius of gyration

$$I = mK^2$$

$$E_{\max} = \frac{1}{2} I \omega_{\max}^2$$

$$E_{\min} = \frac{1}{2} I \omega_{\min}^2$$

∴ Maximum fluctuation of Energy

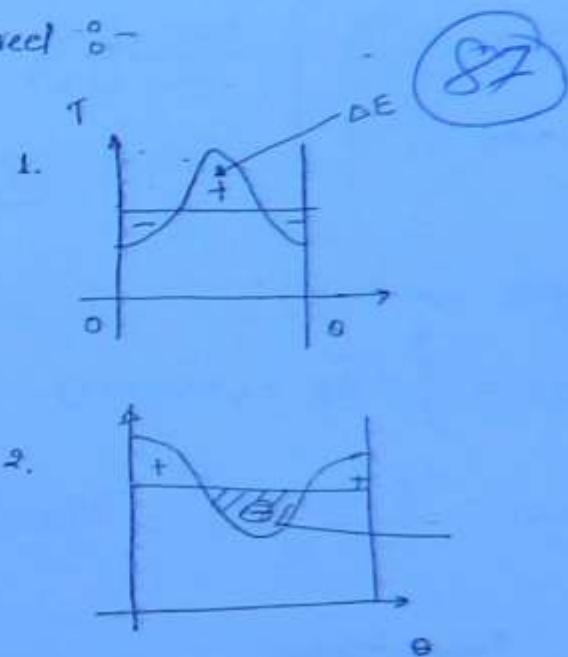

Variation.

$$\Delta E = E_{\max} - E_{\min}$$

$$\Delta E = \frac{1}{2} I (\omega_{\max}^2 - \omega_{\min}^2)$$

$$= \frac{1}{2} I \left(\frac{\omega_{\max} + \omega_{\min}}{2} \right) \left(\frac{\omega_{\max} - \omega_{\min}}{2} \right) \times 2 \times \omega$$

$$\Delta E = I \omega^2 C_S$$

- Q. The turning moment diagram of an engine is represented as the equation $T = 2000 + 9500 \sin 2\theta - 5700 \cos 2\theta$, where θ is the angle turned by the crank from IDC. If the resisting torque is constant and the maximum fluctuation of speed w.r.t to mean speed which is 300 r.p.m. should not be more than 3%. Find

Forced Damped Vibration (Perfect Reality)

FBD

$$m\ddot{x} + c\dot{x} + s\bar{x} - F_0 \sin \omega t = 0$$

$$\ddot{x} + (\frac{c}{m}\zeta\omega_n)\dot{x} + (\frac{\omega_n^2}{m})x = \frac{F_0}{m} \sin \omega t$$

The final solⁿ is $x = CF + P.I.$

(122)

CF $\left[\begin{array}{l} \zeta > 1 \\ \zeta = 1 \\ \zeta < 1 \end{array} \right]$ after sometime $\rightarrow 0$

$D \rightarrow$ Differential operator
 $D^2 = -\omega^2$

$$P.I. = \frac{(F_0/m) \sin \omega t}{D^2 + (2\zeta\omega_n)D + \omega_n^2} =$$

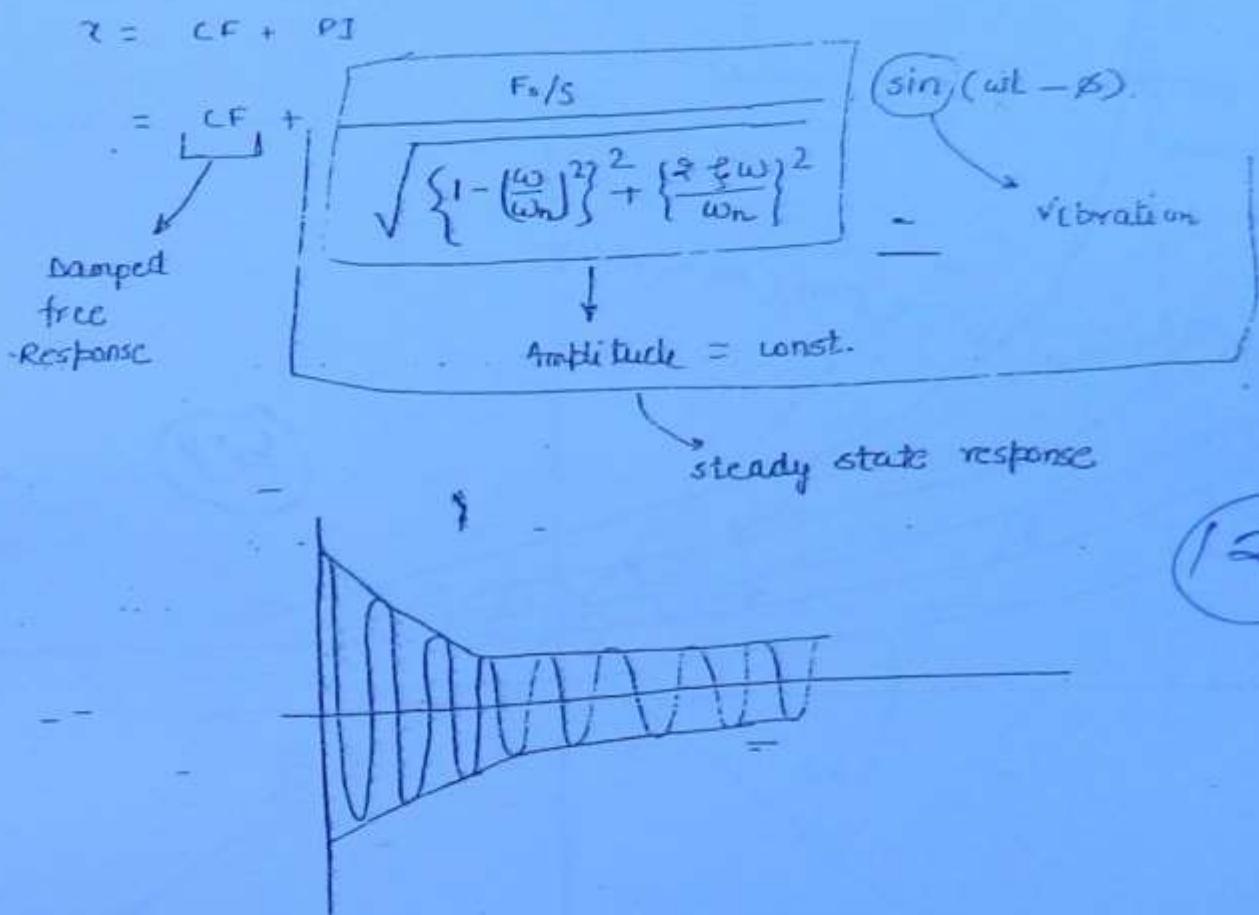

$$= \frac{F_0/m \sin \omega t}{(\omega_n^2 - \omega^2) + (2\zeta\omega_n)D} \times \frac{(\omega_n^2 - \omega^2) - (2\zeta\omega_n)D}{(\omega_n^2 - \omega^2) - (2\zeta\omega_n)D}$$

$$= \frac{F_0}{m} \left[\frac{(\omega_n^2 - \omega^2) \sin \omega t - (2\zeta\omega_n\omega_n) \cos \omega t}{(\omega_n^2 - \omega^2)^2 + (2\zeta\omega_n\omega_n)^2} \right]$$

$$= \frac{\frac{F_0}{m}}{\sqrt{(\omega_n^2 - \omega^2)^2 + (2\zeta\omega_n\omega_n)^2}} \sin(\omega t - \phi)$$

$$= \frac{F_0/s}{\sqrt{\left\{ 1 - \left(\frac{\omega}{\omega_n} \right)^2 \right\}^2 + \left\{ \frac{2\zeta\omega}{\omega_n} \right\}^2}} \sin(\omega t - \phi)$$

Final solⁿ :-

After some time when CF becomes zero

The final solⁿ will be

where, $A \rightarrow$ Amplitude of steady-state Vib.

$A \rightarrow$ Amplitude of forced Vib.

$$x = A \sin(\omega t - \phi)$$

$$A = \frac{F_0/S}{\sqrt{\left\{1 - \left(\frac{\omega}{\omega_n}\right)^2\right\}^2 + \left\{\frac{2\zeta\omega}{\omega_n}\right\}^2}} \Rightarrow \text{const}$$

\therefore the amplitude is const.

\therefore System should have ROLLING LIFE

$$\text{MF} = \frac{A}{F_0/S} = \frac{1}{\sqrt{\left\{1 - \left(\frac{\omega}{\omega_n}\right)^2\right\}^2 + \left\{\frac{2\zeta\omega}{\omega_n}\right\}^2}}$$

$$I x_1^2 \ddot{\theta} + 1500 \times \frac{1}{2}$$

$$\ddot{\theta} + 400 \dot{\theta} = 0$$

CAMS & FOLLOWERS

BIGGEST disadvantage

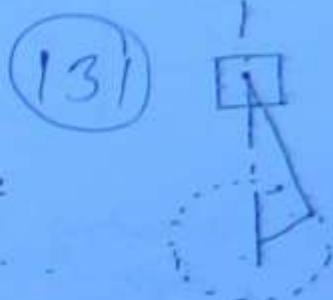

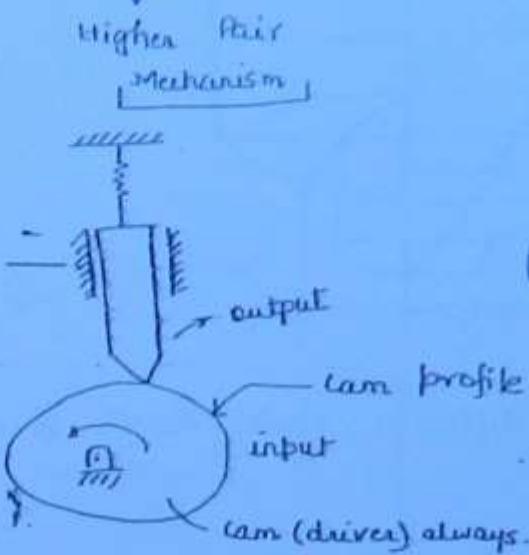

- if profile will
wear

→ dwell period is
that period of
cam in which
cam is rotating
but follower will
not move.

→ these mechanism are cheap

→ less space is required

* Both are equally good.

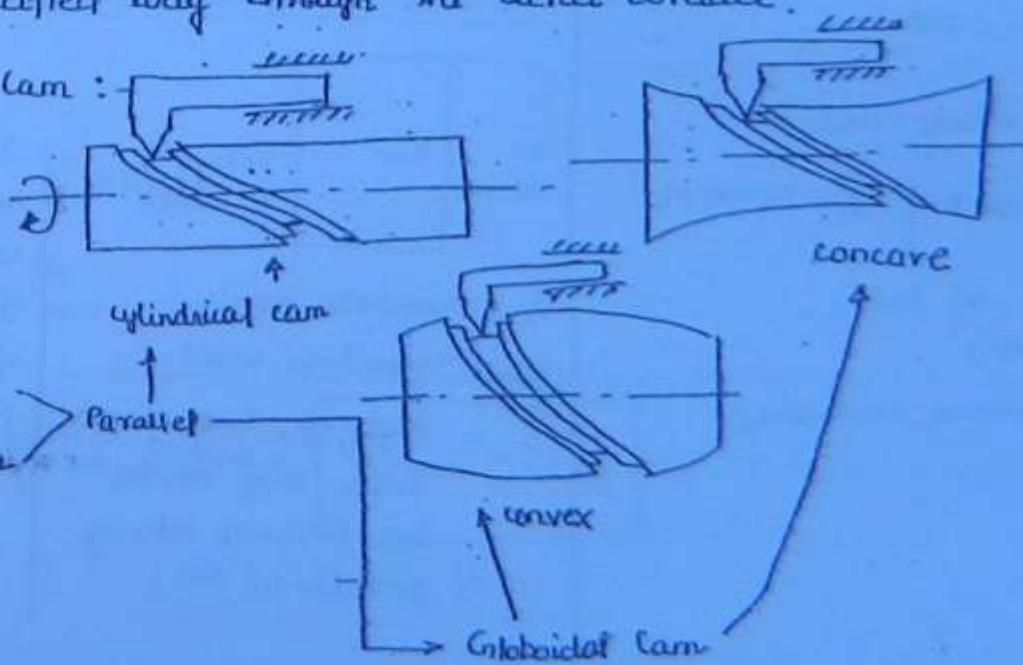

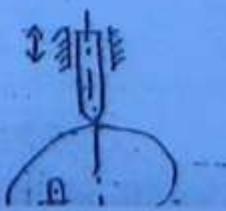

use:- Power Press, valve operating
systems mechanism

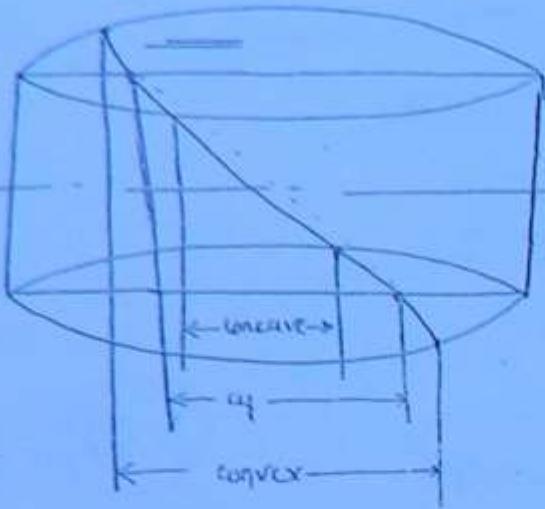

* CAM :-

It's a mechanical element which drives another element known as follower in a specified way through the direct contact.

- Classification of Cam :-

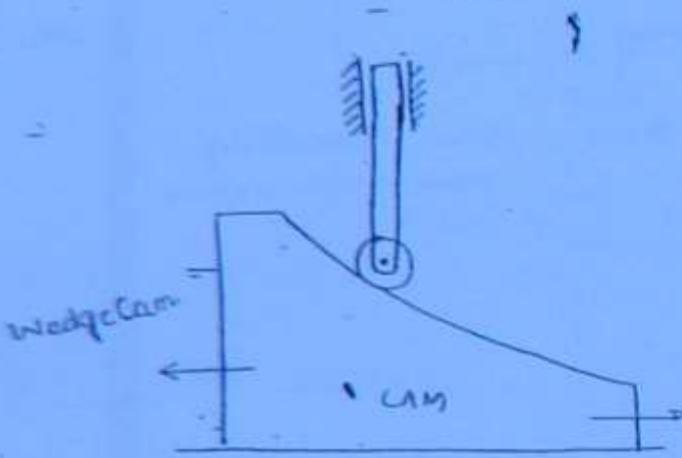

when
 { Axis of rotation of cam
 Line of motion of follower }
 Both are \perp ar

132

Fig. representing different stroke length in same spiral angle.

1. Cam may be

Rot.
Reci

2. Follower may be

Reci.
oscillatory

CAM ← motor

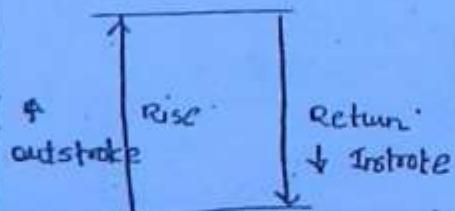

Angular velocity = const. = ω

If cam Rot B. $\frac{d\theta}{dt} = \omega = \text{const.}$

One rot of cam:
($0-2\pi$)

2 → Follower Displacement

In one rot of cam ($0-2\pi$):-

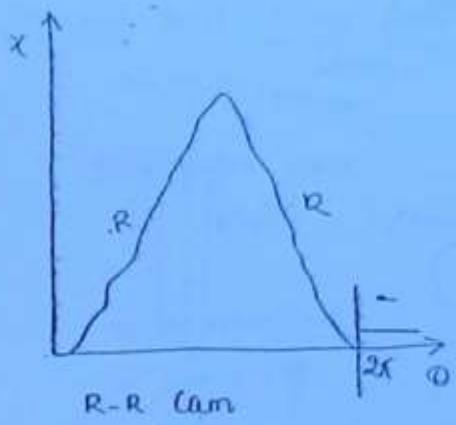

θ_o = outstroke angle

θ_R = Return stroke angle

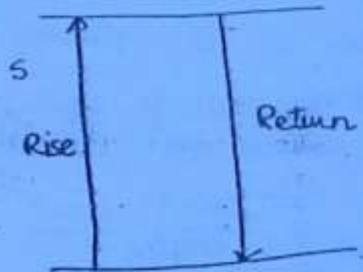

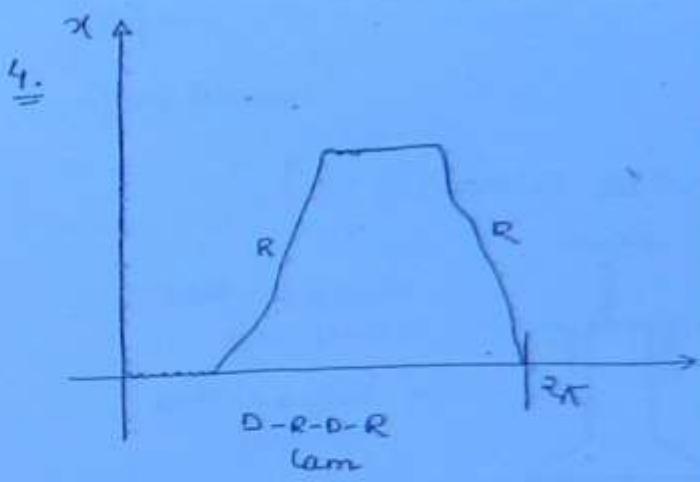

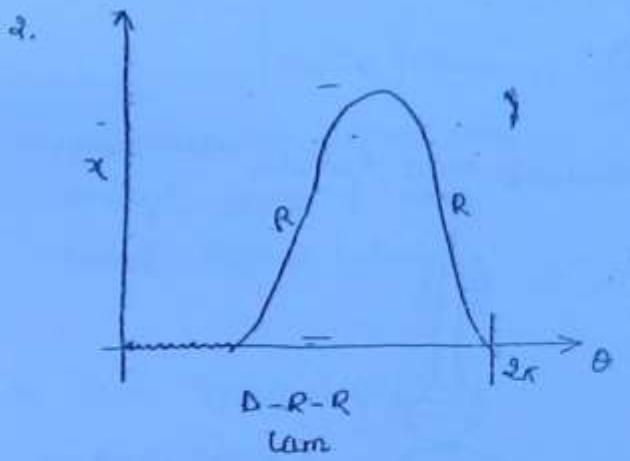

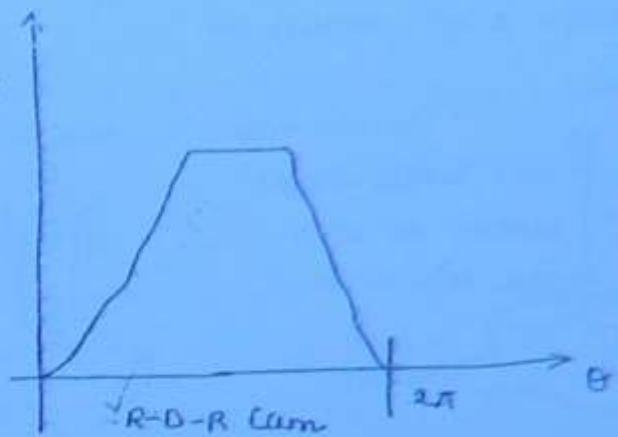

δ = Angle of dwell in which cam rotates.

But follower velocity is zero (is at rest)

Angle of action:-
Angle of rot of cam from beginning of Rise to end of return

(B3)

$s \rightarrow$ stroke length of follower

$$t_0 = \frac{\theta_0}{\omega} \quad | \quad t_R = \frac{\theta_R}{\omega}$$

$$V_{0,\text{mean}} = -\frac{s}{t_0}$$

$$= -\frac{s}{\theta_0/\omega}$$

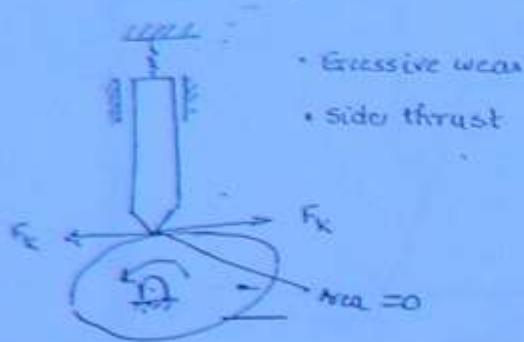

$$V_{0,\text{mean}} = \frac{\omega s}{\theta_0}$$

Similarly,

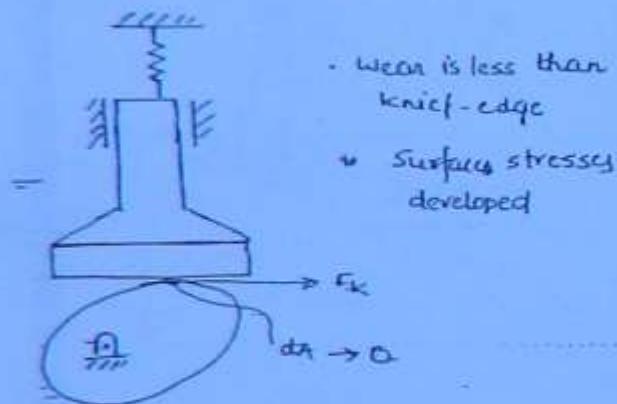

$$V_{R,\text{mean}} = \frac{\omega s}{\theta_R}$$

* Classification of Follower :-

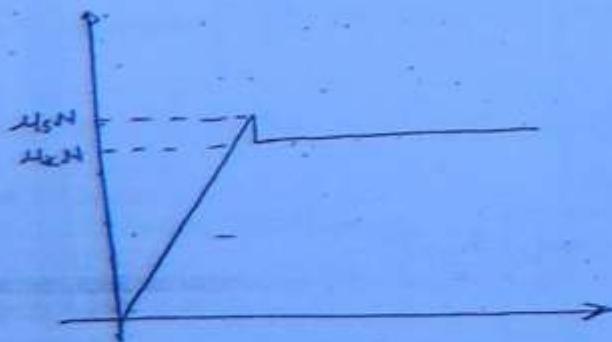

1. Kneif-edge follower :-

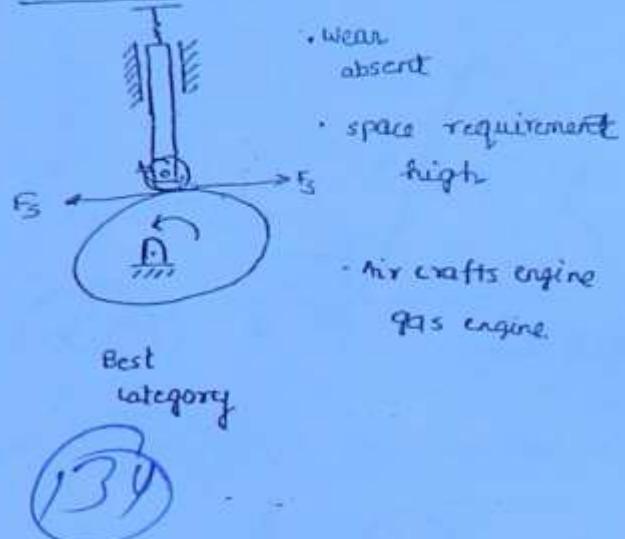

3. Flat-Face Follower :

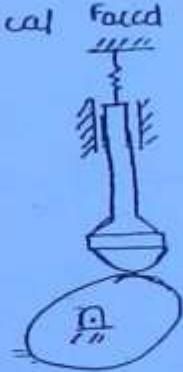

If flat face is circular disc it is called Mushroom follower

2. Roller Follower :

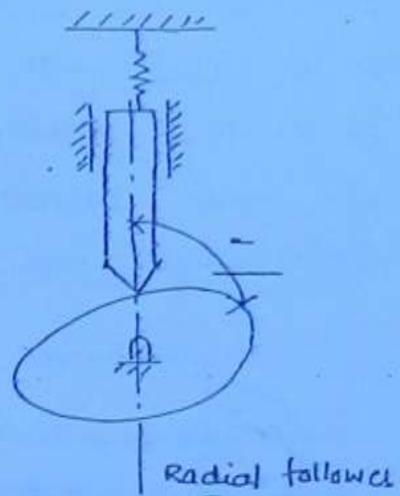

4. Spherical Face Follower

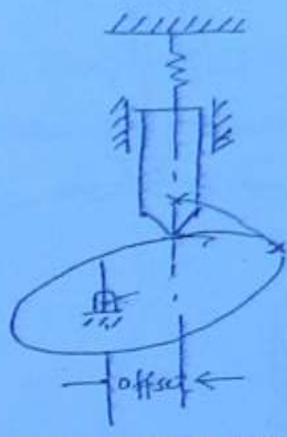

- Wear is less
- surface stresses are less
- used in I.C engine
(Valve operating mechanism)

* Radial and offset follower :-

When line of action pass through centre of cam, it is called Radial follower.

~~near~~ offset was given to reduce ~~near~~ slight wear.

(138)

* Cam Terminology :-

1. Base Circle :-

- Minimum radius circle from the cam centre which touches the cam profile. It is also known as minimum radius of cam.
- size of cam is always defined by size of base circle.

2. Trace Point :-

- It is a point on follower which is required to trace the cam profile. And the curve traced by traced point is known as Pitch curve which will always be parallel to the cam profile.

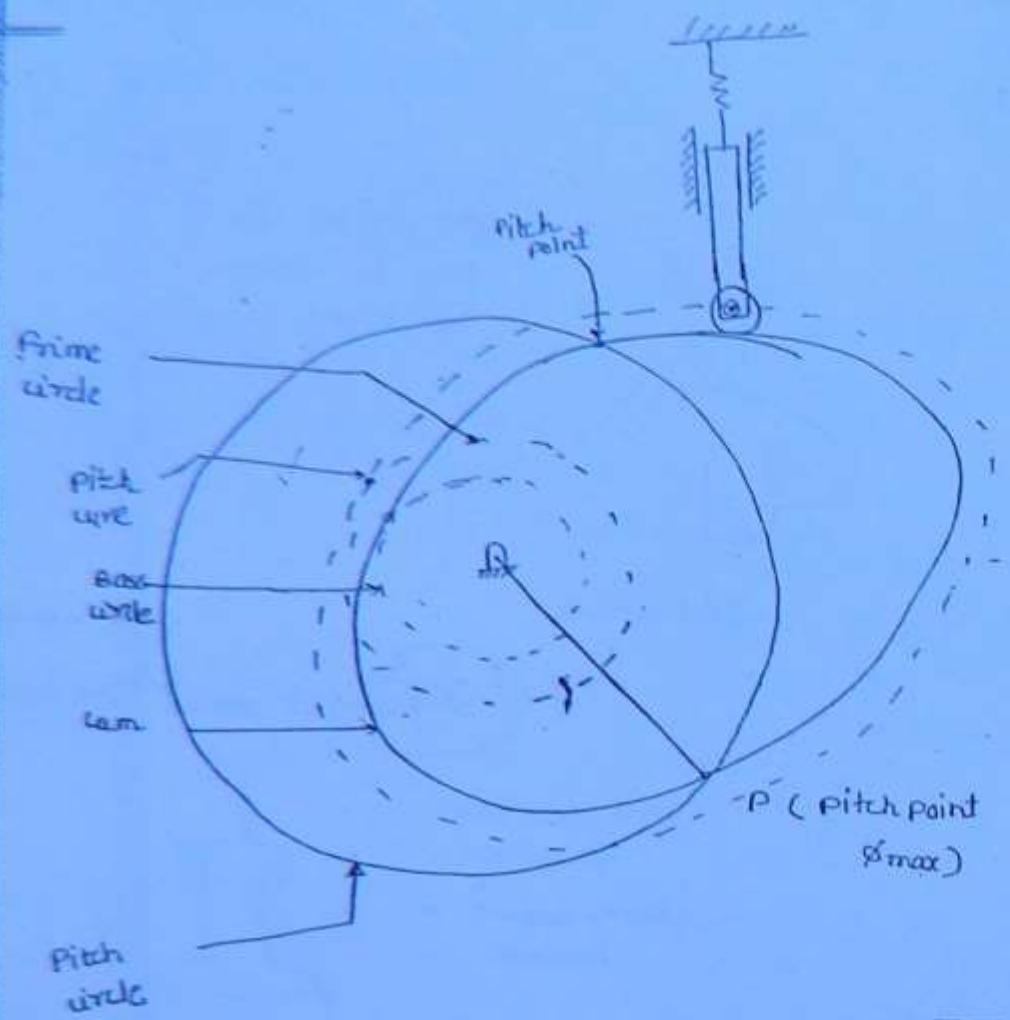

3. Prime Circle :-

Minimum radius circle of the pitch curve which touches the pitch curve is called Prime circle

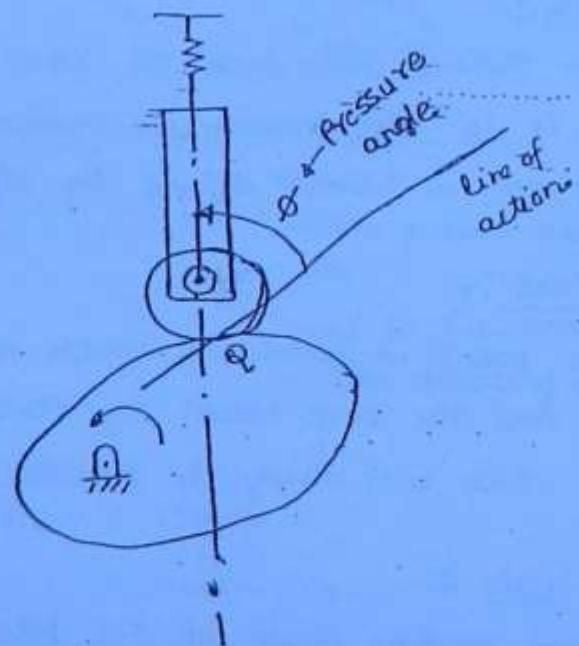

4. Pitch Point :-

The point on ~~which~~ pitch curve where pressure angle is maximum.

5. Pressure angle :-

(136)

* Circular arc Cam with Flat face Follower :-

When the flanks of the cam are tangential to base circle and nose circle and is of convex circular arc such a cam is known as circular arc cam. There are six basic dimensions of the cam and are symmetrical cam.

Basic Dimensions :

r_1 → Radius of Base Circle

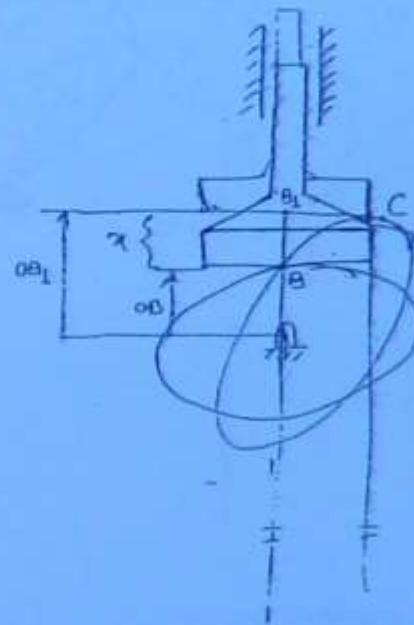

r_2 → Radius of Nose Circle

R → Rad of Flank

α → Semi - Angle of action

ϕ → Angle of Action on Flank

$OQ \Rightarrow L$ (Centre distance from
Base & Nose Circle
centre)

132

Follower on Flank :-

$$\theta \in [0, \alpha]$$

$$z = (OB_1 - OB)$$

$$= (CM - OM)$$

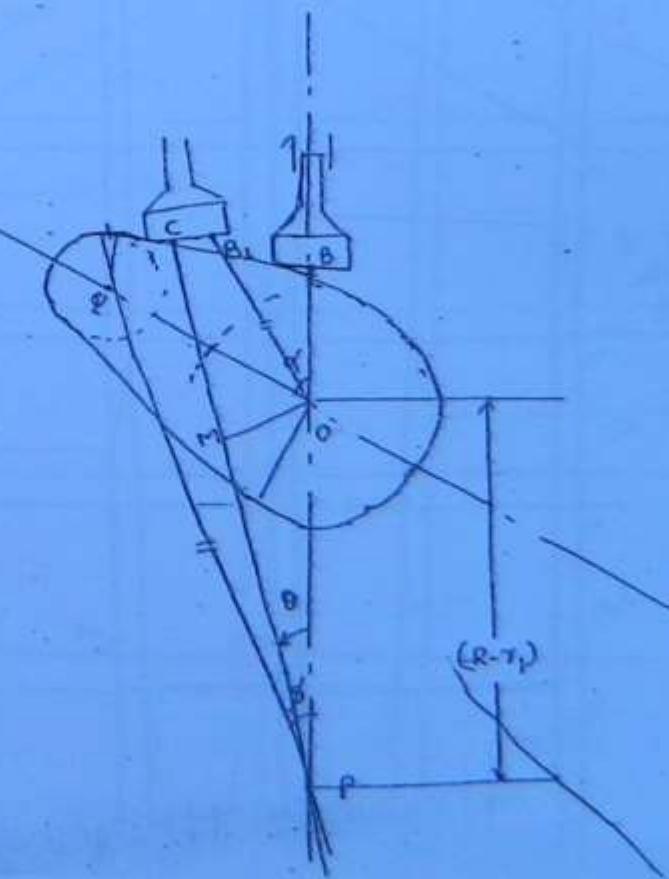

$$= (PC - PM) - r_1$$

$$= R - (R - r_1) \cos \theta - r_1$$

$$x = (R - r_1)(1 - \cos \theta)$$

$$v = \frac{dx}{d\theta} \cdot \left(\frac{d\theta}{dt} \right) \leftarrow \omega$$

$$a = \frac{dv}{d\theta} \cdot \left(\frac{d\theta}{dt} \right)^2 \leftarrow \omega^2$$

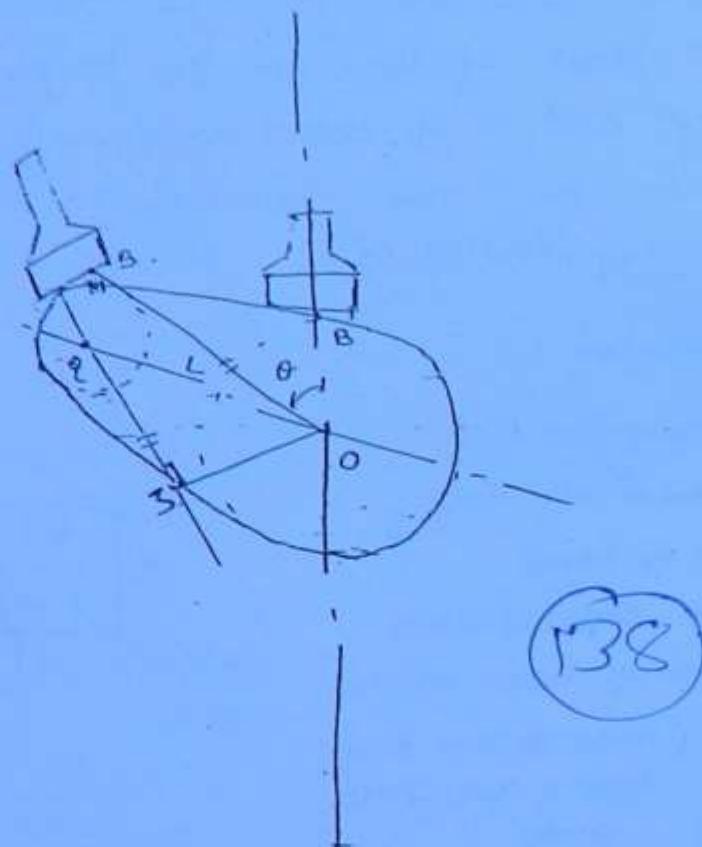

Follower on Nose :-

$$\begin{aligned} z &= OB_1 - OB \\ &= CM - OB \\ &= \alpha(\theta + \epsilon M - \gamma_1) \\ &= (\gamma_2 - \gamma_1) + \epsilon M \end{aligned}$$

$$z = (\gamma_2 - \gamma_1) + L \cos(\alpha - \theta)$$

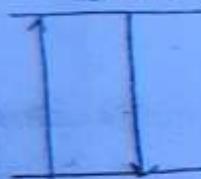

$$\text{lift} \Rightarrow \theta = \alpha$$

$$(\gamma_2 - \gamma_1) + L$$

138

1. Uniform Velocity motion :-

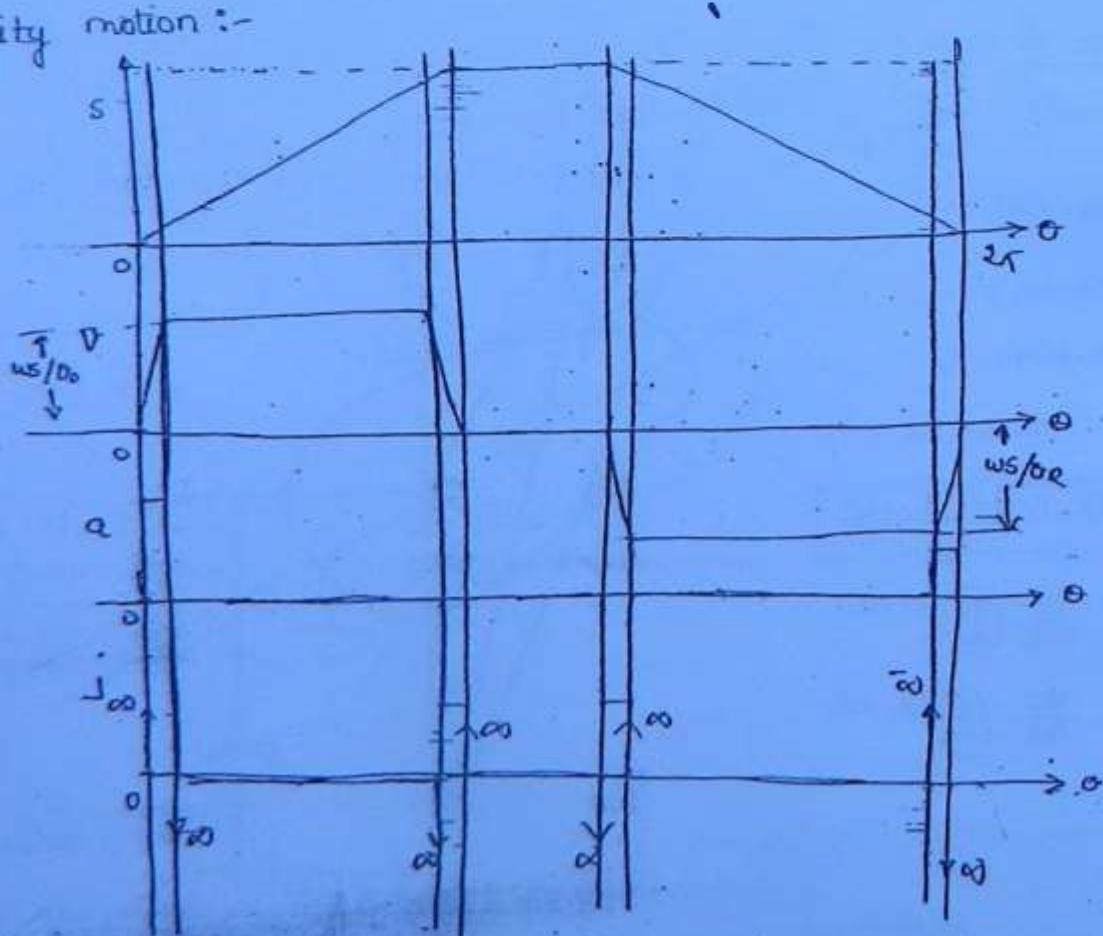

$$V_B = V_{max} = V_{min}$$

$$= \frac{\epsilon s}{\sin \theta}$$

$$V_R = \frac{\epsilon s}{\theta R}$$

use
used in
very very slow
speed

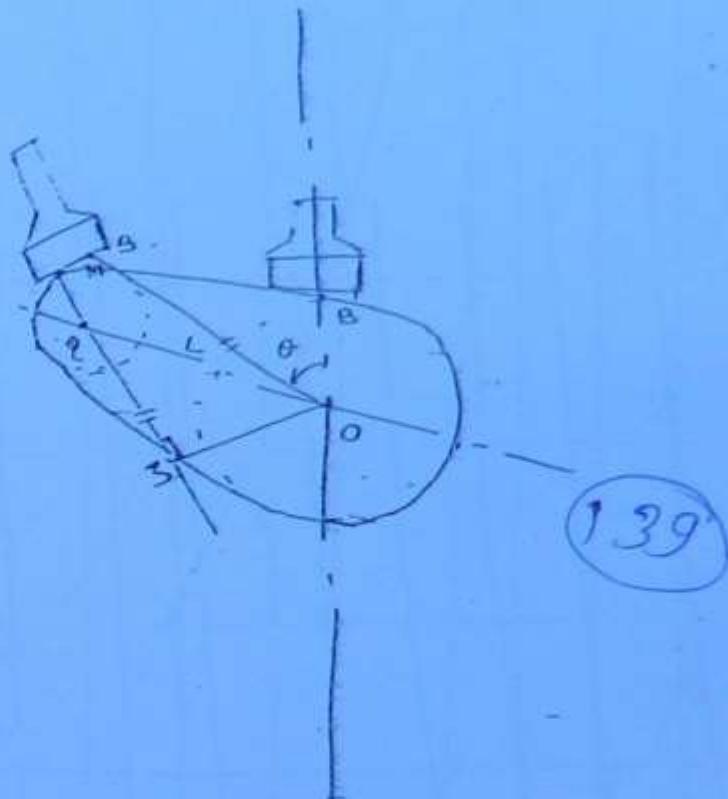

Follower on Nose :-

$$\begin{aligned}
 \tau &= OB_1 - OB \\
 &= CM - OB \\
 &= \omega(r_2 + RM - r_1) \\
 &= (r_2 - r_1) + RM
 \end{aligned}$$

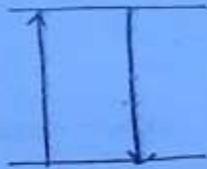

$$\alpha = (r_2 - r_1) + L \cos(\alpha - \theta)$$

$$\text{lift} \Rightarrow \theta = \alpha$$

$$(r_2 - r_1) + L$$

1. Uniform Velocity motion :-

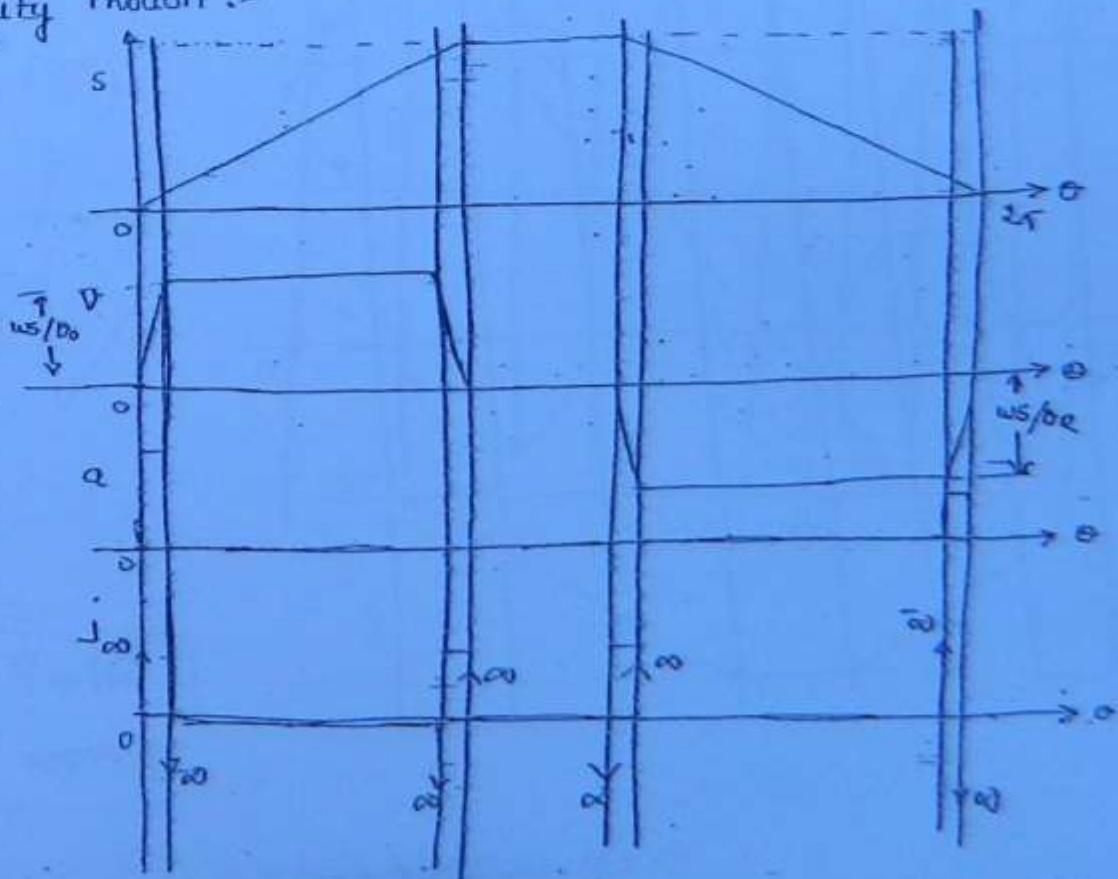

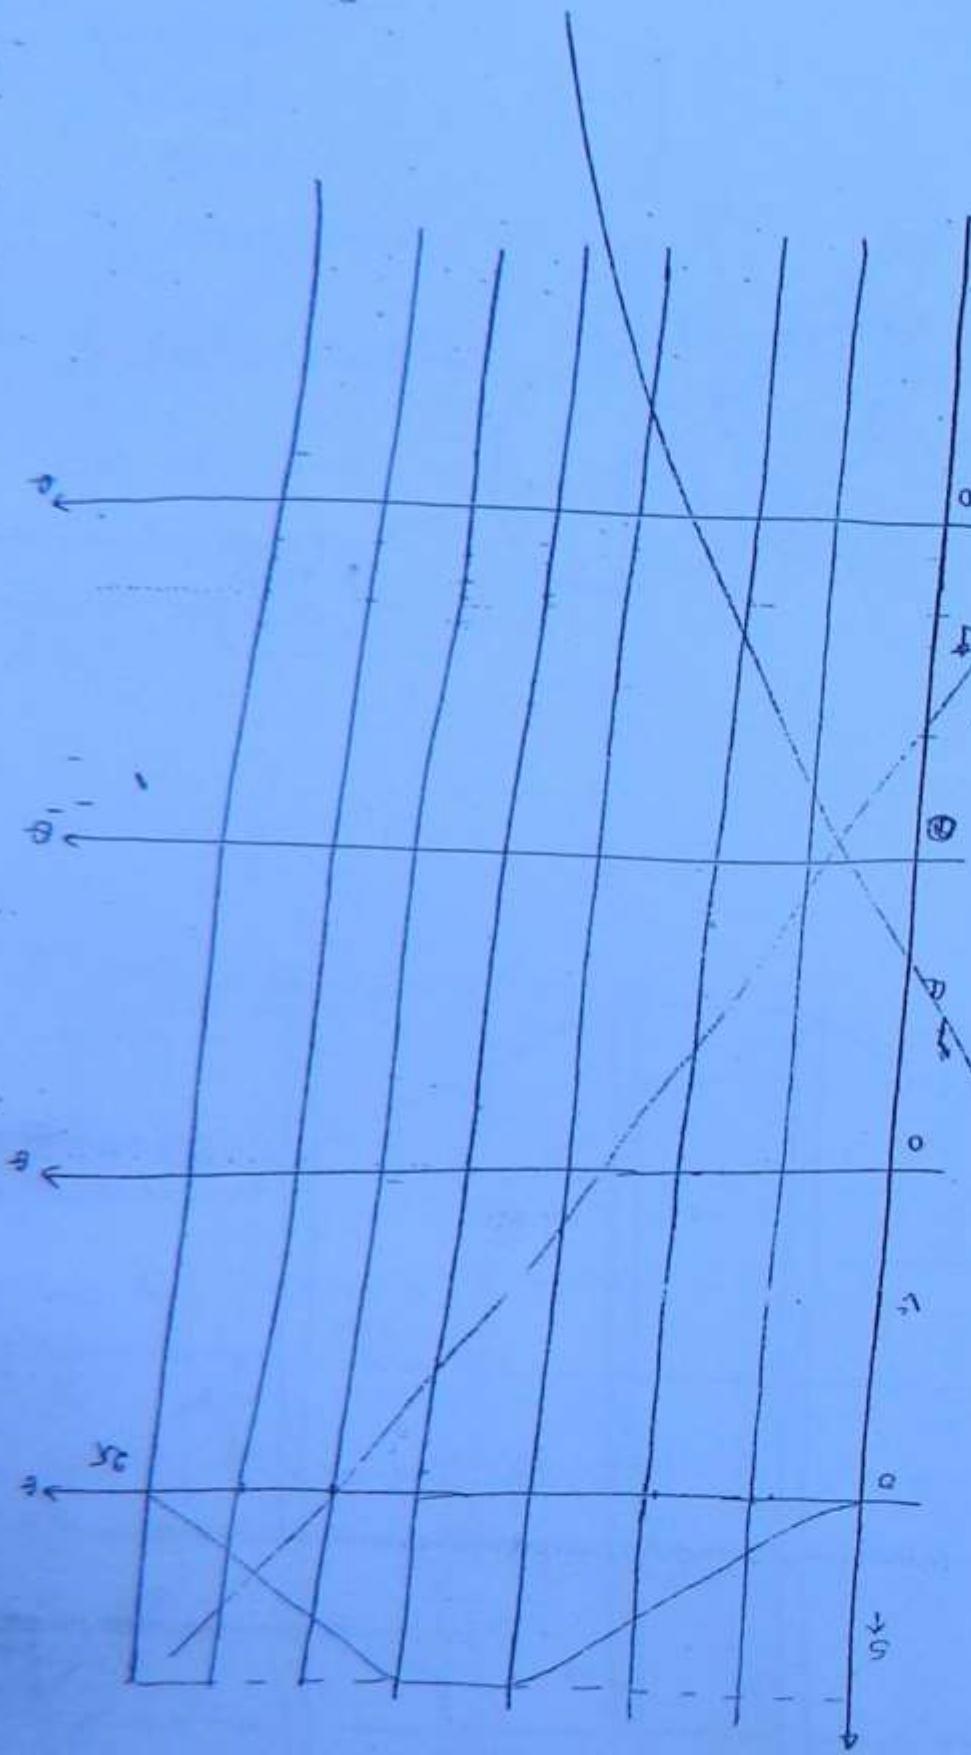

$$V_0 = V_{\text{mean}} = V_{\text{max}}$$

$$= \frac{\omega s}{D}$$

$$V_R = \frac{\omega s}{D_R}$$

can be used in
very very slow
engines

$$\left[\left(\frac{\partial \sigma}{\partial x_0} \right)_{\text{vis}} \frac{\chi}{1 - \frac{\sigma_0}{\Theta}} \right] \xi = \chi$$

4. Cysticidal Motion:

Cycloidal Motion :-

$$x_0 = s \left[\frac{0}{\theta_0} - \frac{1}{2\pi} \sin\left(\frac{2\pi\theta}{\theta_0}\right) \right]$$

$$v_0 = \frac{dx_0}{d\theta} \cdot \frac{d\theta}{dt}$$

$$= s\omega \left[\frac{1}{\theta_0} - \frac{1}{2\pi} \cos\left(\frac{2\pi\theta}{\theta_0}\right) \cdot \frac{2\pi}{\theta_0} \right]$$

$$= \frac{s\omega}{\theta_0} \left[1 - \cos\left(\frac{2\pi\theta}{\theta_0}\right) \right]$$

$\hookrightarrow f(\sin^2\theta)$

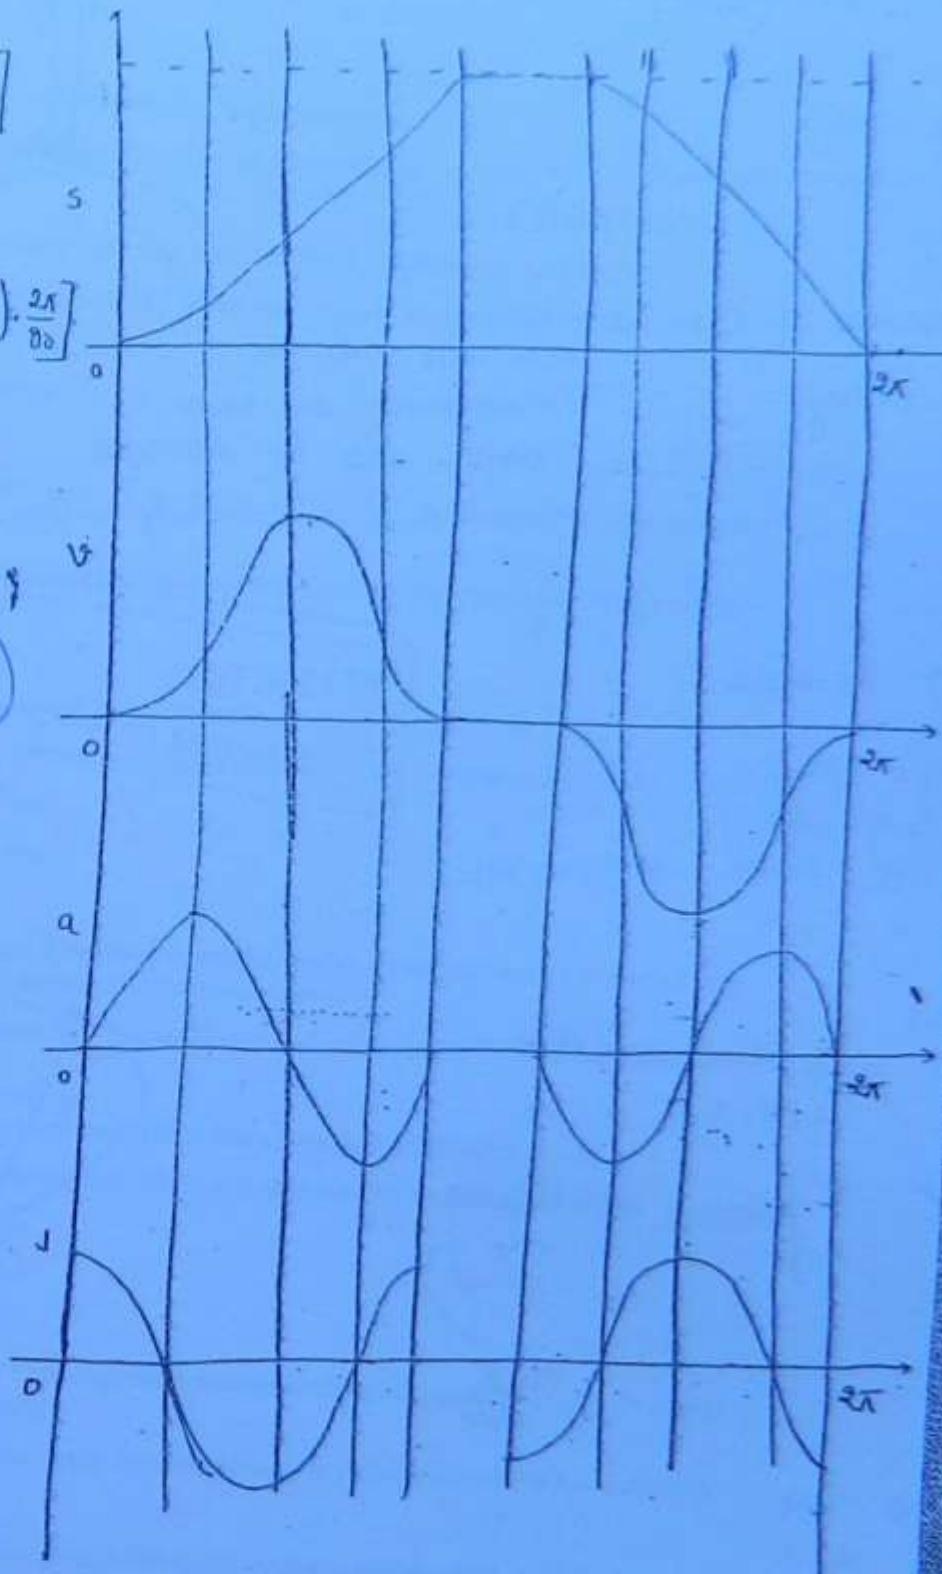

$$a_0 = \frac{dv_0}{d\theta} \cdot \frac{d\theta}{dt}$$

$$= \frac{s\omega^2}{\theta_0} \left[\sin\left(\frac{2\pi\theta}{\theta_0}\right) \cdot \frac{2\pi}{\theta_0} \right]$$

$$= \frac{2\pi s\omega^2}{\theta_0^2} \cdot \sin\left(\frac{2\pi\theta}{\theta_0}\right)$$

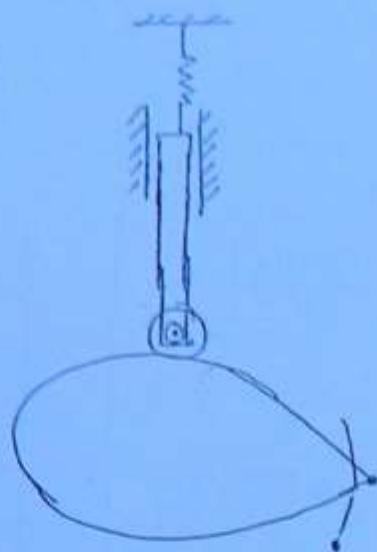

$$T = \frac{4\pi^2 \omega^3 s}{\theta_0^3} \cdot \cos\left(\frac{2\pi\theta}{\theta_0}\right)$$

can be used at very
high speed - [I.C.
engine]

$$\frac{1}{R} = \frac{\left(\frac{dy}{dx}\right)_2^2 + 0}{\left\{1 + \left(\frac{dy}{dx}\right)_2^2\right\}^{3/2}}$$

$\Rightarrow a \rightarrow \infty$
 $\hookrightarrow R \rightarrow 0$
(sharp point).

- interference of cam
- undercutting

• Follower
Cam will rub the
sharp point and cam
Profile will be damaged.
and this is something called interference of cam

Problem :- 25 marks :-

$$r_1 = 25\text{mm}$$

$$r_2 = 5\text{mm}$$

$$\text{lift} = 20\text{mm} \rightarrow (r_2 - r_1) + L$$

$$\alpha = 75^\circ$$
